ASMFC Stock Status Overview

This document provides an overview of stock status for the Commission’s 27 managed species or species groups. Graphs contain the most recent information available and have been vetted through the relevant species technical committee. Where biomass data is lacking, other fishery indicators are used (i.e., landings, fishing mortality rates). Time frames differ based on data availability.

## What Does a Status Mean?

**Rebuilt/Sustainable** - Stock biomass is equal to or above the biomass level established by the FMP to ensure population sustainability. When between benchmark assessments, a stock can still be considered rebuilt/sustainable if it drops below the target but remains above the threshold.
**Recovering/Rebuilding** - Stocks exhibit stable or increasing trends. Stock biomass is between the threshold and the target level established by the FMP.

**Unknown** - There is no accepted stock assessment to estimate stock status.

**Depleted** - Reflects low levels of abundance though it is unclear whether fishing mortality is the primary cause for reduced stock size.

**Concern** – Those stocks developing emerging issues, e.g., increased effort, declining landings, or impacts due to environmental conditions.

**Overfished** - Occurs when stock biomass falls below the threshold established by the FMP, impacting the stock’s reproductive capacity to replace fish removed through harvest, and that decline is driven primarily by fishing mortality.

**Overfishing** - Removing fish from a population at a rate that exceeds the threshold established in the FMP, impacting the stock’s reproductive capacity to replace fish removed through harvest.

**Stable/Unchanged** - Stock biomass has been consistent in recent years.

**Benchmark stock assessment** - A full analysis and review of stock condition, focusing on the consideration of new data sources and newer or improved assessment models. This assessment is generally conducted every 3-5 years and undergoes a formal peer review by a panel of independent scientists who evaluate whether the data and the methods used to produce the assessment are scientifically sound and appropriate for management use.

**Stock assessment update** - Incorporates data from the most recent years into a peer-reviewed assessment model to determine current stock status (abundance and overfishing levels).
Overview of Stock Status
American Eel, *Anguilla rostrata*

**Timeline of Management Actions:** FMP (1999); Addendum I (2006); Addendum II (2008); Addendum III (2013); Addendum IV (2014); Addendum V (2018)

**Management Considerations:**

**Condition:** Depleted

**FMP Stock Rebuilding Goals:** Protect and enhance the abundance of American eel in inland and territorial waters of the Atlantic states and jurisdictions, contribute to the viability of the American eel spawning population, and provide for sustainable fisheries by preventing overharvest.

**FMP Status:** FMP approved in 2000. Addendum I (2006) requires mandatory reporting of catch and effort data. Addendum II (2008) advocates for increased emphasis on improving upstream and downstream passage for American eel. Addenda III (2013) and IV (2014) seek to reduce mortality and increase conservation of American eel stocks across all life stages. Addendum III establishes new management measures for both the commercial (glass, yellow, and silver) and recreational eel fisheries, and implements fishery-independent and -dependent monitoring requirements. Addendum IV (2014) established a 907,671 pound coastwide quota for yellow eel fisheries, reduced Maine’s glass eel quota to 9,688 pounds (2014 landings), and allowed for the continuation of New York’s silver eel weir fishery in the Delaware River. Addendum V (2018) replaces Addendum IV’s measures, increasing the yellow eel coastwide cap starting in 2019 to 916,473 pounds, adjusting the method (management trigger) to reduce total landings to the coastwide cap when the cap has been exceeded, and removing the implementation of state-by-state allocations if the management trigger is met. The Addendum also maintains Maine’s glass eel quota of 9,688 pounds.

July 2019
removing the implementation of state-by-state allocations if the management trigger is met. The Addendum also maintains Maine’s glass eel quota of 9,688 pounds.

**Primary Management Measures:** Recreational fisheries are managed by minimum size limits and possession limits. Commercial fisheries are managed by quotas.

---

**Overview of Stock Status**  
*American Lobster, Homarus americanus*  

**Timeline of Management Actions:** Amendment 3 ('97); Addendum I ('99); Addendum II ('01); Addendum III ('02); Addenda IV & V ('04); Addenda VI & VII ('05); Addenda VIII & IX ('06); Addenda X & XI ('07); Addendum XIII ('08); Addendum XII, XIV & XV ('09); Addendum XVI ('10); Addenda XVII & XVIII ('12); Addenda XIX – XXII ('13); Addendum XXIII ('14); Addendum XXIV ('15); Addendum XXVI ('18)

**Management Considerations:**

**Condition:**
- Gulf of Maine/Georges Bank – Not overfished nor experiencing overfishing
- Southern New England – Depleted and not experiencing overfishing. Abundance is below threshold.

---

**GOM/GBK Stock Abundance for Relative to Reference Points**  
Source: 2020 American Lobster Benchmark Stock Assessment Report

**SNE Stock Abundance Relative to Reference Points**  
Source: 2020 American Lobster Benchmark Stock Assessment Report
Stock Rebuilding Goals:
Extensive research has highlighted the influence of the environment on American lobster life history and population dynamics. As a result, the 2020 benchmark stock assessment analyzed environmental time series were analyzed for regime shifts, which indicate a significant difference in the lobster’s environment and population dynamics from one time period to another. Regime shifts can change a stock’s productivity, impacting the stock’s level of recruitment and its ability to support different levels of catch. Temperature time series were also analyzed to quantify the effect of temperature on survey catchability of lobster and correct trends in abundance estimated from surveys by accounting for temperature-driven changes in catchability through time.

FMP Status:
Amendment 3 and Addenda I – XXVI established 7 management areas and specific management measures to meet the rebuilding schedule by 2022. Addendum XII establishes guidelines for areas implementing a transferable trap program. Addendum XIII finalizes the Outer Cape Cod’s effort control plan. Addendum XIV alters the LCMA trap transfer program. Addendum XV establishes limited entry for LCMA 1 federal water fishermen. Addendum XVI establishes new biological reference points to determine stock status for three stock units. Addendum XVII institutes a 10% reduction in exploitation by all fishing sectors and all gear types starting January 1, 2013 as the first phase in the Board’s efforts to rebuild the Southern New England stock. Addenda XVIII and XIX address the second phase of rebuilding efforts by proposing area-specific measures to scale the scope of the Southern New England fishery to the size of the resource. Addendum XX establishes bottom-sharing in Closed Area 2 in order to protect large concentrations of egg-bearing females and prevent gear conflicts. Addenda XXI and XXII implement changes to the trap transferability program for Areas 2 and 3. Addendum XXIII addresses habitat considerations and Addendum XXIV addresses inconsistencies between federal and Commission regulations on transfers. Addendum XXVI expands the mandatory harvester reporting data elements, improves the spatial resolution of harvester data, establishes a 5-year timeline for implementation of 100% harvester reporting, and prioritizes the development of electronic harvester reporting, as well as improves biological sampling requirements by establishing a baseline of ten sampling trips per year in the American lobster/Jonah crab fishery.

Pending Action:
Following its review of the 2020 Benchmark Stock Assessment and Peer Review Report, the Board reinitiated development of Draft Addendum XXVII, with the goal of increasing the resiliency of the GOM/GBK stock by considering the standardization of management measures across LCMA. This management action is intended to be proactive in response to signs of reduced larval settlement and juvenile recruitment.

Primary Management Measures: Lobster is managed through 7 specific management areas. Each area has unique regulations that can include minimum/maximum size limits, trap limits, and v-notching definitions.
Overview of Stock Status
Atlantic Croaker, *Micropogonias undulatus*

**Timeline of Management Actions:**
- FMP (1987)
- Amendment 1 (2005)
- Addendum I (2011)
- Addendum II (2014)
- Addendum III (2020)

**Management Considerations:**

**Condition:** Unknown; The TLA was recently updated in 2020 to incorporate additional fishery-independent surveys, age and length information, an updated reference period, regional characteristics, and an updated management trigger mechanism. These changes will better represent trends in adult abundance of spot than previous methods.

**FMP Stock Rebuilding Goals (Addendum I):**
- Fishing Mortality Rate (F) Threshold = F_{MSY} (or a reasonable proxy thereof)
- F Target (F_{target}) = a fraction of the F threshold. F target is the rebuilding rate. Exceeding F threshold constitutes overfishing.
- Biomass target = B_{MSY} (or a reasonable proxy thereof)
- B Target = B_{target} = a fraction of the biomass target. Falling below B threshold constitutes overfished.

**FMP Status:** Amendment 1 revised FMP goals and objectives and established biological reference points. Addendum I revised the management area to assess the stock on a coastwide basis and adopted biological reference points. Addendum II established the TLA to assess stock trends and initiate management response. Addendum III updates the TLA’s management trigger mechanism, management responses to TLA triggers, and evaluation of the fishery’s response to measures implemented if triggers occur.
Primary Management Measures: In each non-assessment year, the Atlantic Croaker Technical Committee uses the TLA to evaluate changes in stock trends and the fishery. Coastwide management actions are triggered if both characteristics (harvest and abundance) in either region exceed threshold levels of red for 3 of the 4 most recent years. In 2020, the TLA indicated a moderate level of concern for the harvest metric in the Mid-Atlantic and South Atlantic regions, and for abundance in the Mid-Atlantic region, triggering a management response.
Overview of Stock Status
Atlantic Herring, *Clupea harengus*

Timeline of Management Actions:
FMP (1993); Amendment 1 (1999); Amendment 2 (2006); Technical Addendum I (2006); Addendum I (2009); Addendum II (2010); Addendum V (2012); Addendum VI (2013); Amendment 3 (2016); Addendum I (2017); Addendum II (2019)

Management Considerations:
Condition: Overfished but overfishing is not occurring.

FMP Reference Points and Current Values:
SSB Target = 189,000 mt; SSB Threshold = 94,500 mt; 2017 SSB = 141,473 mt
Fishing Mortality Threshold (FMSY) = 0.51; 2017 F = 0.45
2017 Recruitment = 392 million fish (below average of 4,163 million fish)

FMP Status:
Amendment 3, approved in February 2016, refines the spawning closure monitoring system and modifies the fixed gear set-aside. The Amendment consolidates prior amendments (and associated addenda) and recent management decisions into a single document; it is now the guiding management document for the Area 1A Atlantic Herring fishery. Addendum I to Amendment 3 includes management measures to stabilize the rate of catch in Area 1A and distribute the seasonal quota throughout Trimester 2 (June through September), which has 72.8% of the annual allocation. Addendum II to Amendment 3 strengthens spawning protections in Area 1A (inshore Gulf of Maine) by initiating a closure when a lower percentage of the population is spawning, extending the closure for a longer time, and modifying the trigger level necessary to reclose the fishery.

Primary Management Measures:
Due to concerns regarding projected declines in herring biomass, the NEFMC and ASMFC set the ACL for the 2020 fishing season at 25.5 million pounds (11,571 metric tons). The ACL is further subdivided as follows: Area 1A = 7.3 million pounds, Area 1B = 1.1 million pounds, Area 2 = 7.1 million pounds, and Area 3 = 9.9 million pounds. After adjusting for the research set-aside, the 30 mt fixed gear set-aside, and the 8% buffer (Area 1A closes at 92% of the sub-ACL), the Area 1A sub-annual catch limit (sub-ACL) is 6.8 million pounds (3,076 mt). For 2020, the Area 1A sub-ACL is further distributed seasonally with 72.8% of the quota available from June through September and 27.2% allocated from October through December. Directed fisheries within a management area close when 92% of the sub-ACL has been harvested, and the stock-wide fishery closes when 95% of the ACL is projected to be reached.
Overview of Stock Status
Atlantic Herring, *Clupea harengus*

Pending Action:
In February 2020, the Board approved addendum III to consider new approaches for managing the Area sub-ACL under low quota scenarios for the 2020 fishing season and consider expanding landing provisions for permit holders within the days out program. In May 2020, the Board postponed final action on Addendum III until a final rule for the Council's Amendment 8 has been published and the Council has had opportunity to review the findings of the 2020 the Management Track Assessment.

Atlantic Menhaden Fecundity
Source: ASMFC Atlantic Menhaden Single-Species and ERP Benchmark Stock Assessment, 2020

October 2020
Overview of Stock Status
Atlantic Menhaden, *Brevoortia tyrannus*

**Timeline of Management Actions:** FMP (1981); FMP Revision (1991); Amendment 1 (2001); Addendum I (2004); Addendum II (2005); Addendum III (2006); Addendum IV (2009); Addendum V (2011); Amendment 2 (2012); Technical Addendum I (2013); Addendum I (2016); Amendment 3 (2017)

**Management Considerations**
**Condition:** Not overfished and not experiencing overfishing (2020 single-species and ecological reference points (ERP) benchmark stock assessments)

**FMP Stock Rebuilding Goals:**
- ERP Fishing Mortality Target = 0.19
- ERP Fishing Mortality Threshold = 0.57
- Current Fishing Mortality (2017) = 0.16
- ERP Fecundity Target = 2.004 quadrillions of eggs
- ERP Fecundity Threshold = 1.493 quadrillions of eggs
- Current Fecundity (2017) = 2.602 quadrillions of eggs

**FMP Status:** Amendment 3, approved in November 2017, maintained the single-species biological reference points through 2019, and addresses allocation, quota transfers, quota rollovers, incidental catch, the episodic events set aside program, and the Chesapeake Bay reduction fishery cap. Amendment 3 also changes fishery allocations in order to strike an improved balance between gear types and jurisdictions. The Amendment allocates a baseline quota of 0.5% to each jurisdiction, and then allocates the rest of the total allowable catch (TAC) based on historic landings between 2009 and 2011 (see accompanying table). This measure provides fishing opportunities to states that currently have little quota while still recognizing historic landings in the fishery. The Amendment also maintains the quota transfer process, prohibits the rollover of unused quota, maintains the 6,000 lb trip limit for non-directed and small-scale gears following the closure of a directed fishery, and sets aside 1% of the TAC for episodic events in the states of New York through Maine.

In August 2020, the Board approved the following Ecological Reference Points (ERPs) for the management of Atlantic menhaden: ERP target: The maximum fishing mortality rate ($F$) on Atlantic menhaden that sustains Atlantic striped bass at their biomass target when striped bass are fished at their $F$ target and the ERP threshold: The maximum $F$ on Atlantic menhaden that keeps Atlantic striped bass at their biomass threshold when striped bass are fished at their $F$ target.

**Primary Management Measures:** The Atlantic Menhaden Management Board (Board) approved a total allowable catch (TAC) of 194,400 metric tons (mt) for the 2021 and 2022 fishing seasons, which represents a 10% reduction from the 2018-2020 TAC level. The 2021-2022 TAC was set based on ERPs. See accompanying table for state percent shares of the TAC. States must close their fisheries when the state-specific portion of the TAC has been reached.
### Overview of Stock Status

**Atlantic Striped Bass, Morone saxatilis**

**Timeline of Management Actions:** FMP (1981); Amendment 6 (2003); Addendum I (2007); Addendum II (2010); Addendum III (2012); Addendum IV (2014); Addendum VI (2019)

**Management Considerations**

**Condition:** Overfished and overfishing occurring (2018 Benchmark Stock Assessment and Peer Review)

**FMP Stock Control Rules:**

- \( SSB_{\text{target}} = 252 \text{ million pounds} \)
- \( F_{\text{target}} = 0.20 \)
- \( SSB_{\text{threshold}} = 202 \text{ million pounds} \)
- \( F_{\text{threshold}} = 0.24 \)
- \( SSB = 151 \text{ million pounds} \)
- \( F_{2017} = 0.31 \)

**FMP Status:** Amendment 6 (2003) established new biological reference points and triggers for Board action. Addendum I (2007) established a data collection program to increase accuracy of discard and discard mortality estimates. Addendum III (2012) established a mandatory commercial tagging program for all states and jurisdictions with commercial striped bass fisheries and recommended increasing penalties for illegally harvested fish. Addendum IV (2014) established new fishing mortality (\( F \)) reference points and required harvest reductions to reduce \( F \) to the new \( F \) target; coastal states to implement measures to reduce harvest by 25% relative to 2013 levels, and Chesapeake Bay states/jurisdictions implemented measures to reduce harvest by 20.5% relative to 2012 levels. Addendum VI (2019) responds to the recent overfishing status determination, and called for an 18% reduction in total removals to reduce \( F \) to the target level. To achieve this, all state commercial quotas were reduced by 18%, and recreational fisheries implemented a 1 fish bag limit and a 28” to less than 35” slot limit for the ocean region and a 1 fish bag limit and an 18” minimum size limit for Chesapeake Bay in order to reduce total removals by 18% at the coastwide level. States were able to implemented alternative regulations through conservation equivalency by demonstrating an 18% reduction in removals at the state-level. States implemented final regulations in April 2020. Additionally, since catch and release practices contribute significantly to overall fishing mortality, the Addendum mandates the use of circle hooks when fishing with bait to reduce release mortality in recreational striped bass fisheries. States must implement mandatory circle hook requirements by January 1, 2021.

**October 2020**
Overview of Stock Status
Atlantic Striped Bass, *Morone saxatilis*

**Primary Management Measures:** Commercial harvest is managed through state-by-state quotas (for ocean and bay fisheries), minimum size limits, and seasons. The recreational fishery is managed through bag and size limits (and seasons in some states).

**Pending Management Action:** In August 2020, the Board initiated development of Draft Amendment 7 to the FMP. The Public Information Document, which is the first step in the adaptive management process, will focus on the following management topics: (1) fishery goals and objectives; (2) stock rebuilding/timeframe; (3) management triggers; (4) biological reference points; (5) regional management (recreational measures, coastal and producer areas, regional reference points); (6) recreational discard mortality; (7) conservation equivalency; (8) recreational accountability; and (9) coastal commercial quota allocation. The purpose of the PID is to solicit stakeholder feedback on any issues concerning the management of the striped bass stock and fishery, and to prioritize the importance of each topic for continued development and inclusion in the Draft Amendment. The Board will review a draft of the PID at the Commission’s Winter Meeting in February. At that meeting, the Board will determine if the PID is ready to be sent out for public comment or if further modifications to the document are needed.
Management Considerations:
Condition:
Depleted (ASMFC Benchmark Stock Assessment 2017); NOAA Fisheries listed Atlantic sturgeon under the Endangered Species Act in 2012.

FMP Stock Rebuilding Goals:
To have at least 20 protected age classes of females in each spawning stock.

FMP Rebuilding Schedule:
Approximately 20 to 40 years from initiation of Amendment 1 (1998), depending on a number of factors, including individual spawning stock’s maturity rate; longevity; geographic area; and length of prior fishery closures.

FMP Status:
FMP approved in 1990 and Amendment 1 approved in 1998 to initiate a moratorium. Addendum I was approved in 2001; Addendum II in May 2005; Addendum III in November 2006. Combined, all three Addenda permit the importation of non-indigenous Atlantic sturgeon as well as the development of private Atlantic sturgeon aquaculture facilities in Florida and North Carolina. Addendum IV, approved in 2012, updates habitat information and identifies areas of concern and research needs.

Primary Management Measures:
Amendment 1 mandated all Atlantic coastal states enact a moratorium on harvest and possession of Atlantic sturgeon. Exemptions to the moratorium on possession are detailed in the FMP.

Overview of Stock Status
Black Drum, *Pogonias cromis*

**Timeline of Management Actions:** FMP (2013); Addendum I (2018)

**Management Considerations**

**Condition:** Not overfished and not experiencing overfishing

**FMP Stock Rebuilding Goals:** None

**FMP Rebuilding Schedule:** None

**FMP Status:** The Black Drum FMP was approved in June 2013. Addendum I allows Maryland to reopen its black drum commercial fishery in the Chesapeake Bay with a daily vessel limit of up to 10 fish and a 28-inch minimum size.

**Primary Management Measures:** The FMP requires all states to maintain current regulations for black drum and to implement a maximum possession limit and a minimum size limit of no less than 14 inches. The FMP also establishes a management framework to address future concerns or changes in the fishery or population.

**FMP Status:** The Black Drum FMP was approved in June 2013. Addendum I allows Maryland to reopen its black drum commercial fishery in the Chesapeake Bay with a daily vessel limit of up to 10 fish and a 28-inch minimum size.

**Primary Management Measures:** The FMP requires all states to maintain current regulations for black drum and to implement a maximum possession limit and a minimum size limit of no less than 14 inches. The FMP also establishes a management framework to address future concerns or changes in the fishery or population.
Overview of Stock Status
Black Sea Bass, *Centropristis striata*

Management Considerations:
**Condition:** Although the resource was declared rebuilt in 2009, black sea bass’ unique life history characteristics (e.g., the species changes sex from female to male) contributes to some level of uncertainty about the size of the stock and the species’ response to exploitation. The 2019 operational assessment indicates the resource is neither overfished nor experiencing overfishing.

**FMP Biological Reference Points:**
- SSB Target = 31.07 million pounds
- SSB Threshold = 15.53 million pounds
- Fishing Mortality Threshold = 0.46

*Timeline of Management Actions:* FMP ('96); Amendment 10 ('97); Amendment 11 ('98); Amendment 12 ('99); Amendment 13 ('02); Addenda XII & XIII ('04); Addendum XVI ('05); Addendum XIX ('07); Addendum XX ('09); Addendum XXII ('11); Addendum XXII ('12); Addendum XXIII ('13); Addendum XXV ('14); Addendum XXVII ('16); Addenda XXX, XXXI and XXXII ('18)
Overview of Stock Status  
Black Sea Bass, *Centropristis striata* 

**FMP Status:**

**Primary Management Measures:**
Annual total allowable landings (TAL) divided into a state-by-state commercial quota (49% of TAL) and recreational harvest limit (51% of TAL). Coastwide commercial management measures include minimum fish and mesh sizes, as well as pot/trap specifications. The recreational fishery allocates the coastwide Recreational Harvest Limit (RHL) to the three management regions of Massachusetts through New York (61.35% of RHL), New Jersey (30.24%), and Delaware through North Carolina (8.41%).

**Pending Actions:**
*Summer Flounder, Scup, and Black Sea Bass Commercial/Recreational Allocations Amendment*
In October 2019, the Board and the Council initiated the development of a joint amendment to reevaluate the FMP’s commercial and recreational allocations. This action aims to address the allocation-related impacts of the revised recreational catch and landings data provided by MRIP. The Draft Amendment is currently out for public comment until March 2021.

*Black Sea Bass Commercial Addendum*
The Board and Council will be considering approval of Addendum XXXIII in February 2021. The Addendum considers changes to black sea bass commercial state allocations.

September 2020
Overview of Stock Status
Bluefish, *Pomatomus saltatrix*

**Timeline of Management Actions:** FMP (1980); Amendment 1 (1998); Addendum I (2012)

**Management Considerations**
**Condition:** Overfished and not experiencing overfishing

**Biological Reference Points from 2019 Operational Assessment:**
- Spawning Stock Biomass threshold = 219 million lbs
- Spawning Stock Biomass$_{2018}$ = 201 million lbs
- Fishing Mortality Threshold ($F_{\text{MSY PROXY}} = F_{35\% \text{ SPR}}$) = 0.183
- Fishing Mortality$_{2018}$ = 0.146

**FMP Status:** Joint management with the MAFMC. Addendum I establishes a coastwide sampling program to improve the quantity and quality of information available for use in future bluefish stock assessments. The Commission and MAFMC are continuing work on the development of a rebuilding plan as part of the Bluefish Allocation and Rebuilding Amendment, which will consider revising the FMP goals and objectives, allocations between sectors and states, and the quota transfer process.
Overview of Stock Status  
Bluefish, *Pomatomus saltatrix*

**Management Measures:** Annual total allowable landings (TAL) are divided into a commercial quota (17% of TAL) and a recreational harvest limit (83% of TAL). The commercial fishery is controlled through state-by-state quotas based on historic landings from 1981-1989. The recreational fishery is managed under a coastwide 3-fish bag limit for private anglers and shore-based fishermen, and a 5-fish bag limit for for-hire fishermen. The Commission and Council approved an acceptable biological catch (ABC) limit of 16.28 million pounds for the 2021 fishing season. After accounting for discards, the ABC translates to a commercial quota of 2.77 million pounds and a recreational harvest limit of 8.34 million pounds.

**Pending Actions:** The Commission and Council are working on the development of a rebuilding plan as part of the Bluefish Allocation and Rebuilding Amendment, which will consider revising the FMP goals and objectives, allocations between sectors and states, and the quota transfer process. Additional information and updates on this action are available at [http://www.mafmc.org/actions/bluefish-allocation-amendment](http://www.mafmc.org/actions/bluefish-allocation-amendment)
Overview of Stock Status
Coastal Sharks

Management Considerations
Condition: See accompanying table for stock status information by species and species group.

Timeline of Management Actions: FMP (2008); Addendum I (2000); Addenda II & III (2013); Addendum IV (2016); Addendum V (2018)

Primary Management Measures
Commercial and recreational fishermen are prohibited from possessing silky, tiger, blacktip, spinner, bull, lemon, nurse, scalloped hammerhead, great hammerhead, and smooth hammerhead shark species from May 15 – July 15 from VA-NJ to protect pupping females. All fishermen, with the exception of commercial fishermen who land smooth dogfish, are required to keep fins attached to the carcass through landing. Addendum I modifies the FMP to allow commercial fishermen to process (remove the fins from) smooth dogfish at sea from March – June of each year but requires a 5-95% fin-to-carcass ratio for all dressed smooth dogfish carcasses. Addendum II modifies the FMP to allow commercial fishermen to process smooth dogfish year round but requires a 12-88% fin-to-carcass ratio. Addendum III updates species groupings to ensure consistency with NOAA Fisheries and increases the recreational size limit for hammerhead sharks. Addendum IV requires smooth dogfish carcasses to be landed with corresponding fins attached if the trip does not meet the 25% catch composition requirement. Addendum V allows the Board to respond to changes in the stock status of coastal shark populations and adjust regulations through Board action rather than an addendum, ensuring greater consistency between state and federal shark regulations.

Recreational fishermen are prohibited from harvesting any species that is illegal to land in federal waters. Recreational fishing is controlled through minimum size limits with a 6.5’ fork length size limit for the hammerhead species group; and a 4.5’ fork length size limit for all other species except for Atlantic sharpnose, finetooth, blacknose, smooth dogfish, and bonnethead, which do not have size limits. Additionally, in April 2019, the Board approved minimum size

limits for shortfin mako (5.92’ fork length size for males, 6.92’ fork length size for females) to be consistent with regulations set in federal waters in response to the 2017 stock assessment that found the resource is overfished and experiencing overfishing. Recreational anglers can only harvest sharks caught with a handline or rod & reel.

The commercial fishery is managed based on MSY using quotas and possession limits to control harvest level and effort. Sharks are split into eight commercial species groups based on fisheries, biology, and stock status — prohibited, research, small coastal, blacknose, aggregated large coastal, hammerhead, pelagic, and smoothhound (see table for species by species grouping). ASMFC does not set quotas for the blacknose, hammerhead, SCS, LCS, or pelagic species groups but rather opens and closes the fishery in response to the federal quota. As of 2016, smooth dogfish are subject to the state-share allocation, developed under Addendum II. Fishing effort for the smoothhound, blacknose, hammerhead, SCS, LCS, and pelagic species groups is controlled through possession limits; fishermen may harvest species within these groups as long as the fishery is open and all sharks are caught according to the regulations contained in the FMP.

Commercial fishermen must have a general state commercial fishing license or permit to harvest sharks. Dealers are required to hold a federal Commercial Shark Dealer permit to buy and sell sharks. Federal dealer permits are required in order to monitor the quota as efficiently as possible and reduce the chance of quota overages. Fishermen may use handlines, gillnets, trawl nets, shortlines, pound nets/fish traps, and weirs to harvest sharks commercially. Captains and vessel owners must use circle hooks and attend a Protected Species Safe Handling, Release, and Identification Workshop offered by NOAA Fisheries in order to harvest sharks using shortlines.
Overview of Stock Status
Cobia, *Rachycentron canadum*

Atlantic Cobia Recreational and Commercial Landings
Source: NOAA Fisheries, Fisheries Statistics Division, 2019; ACCSP Data Warehouse, 2019

Atlantic Cobia Spawning Stock Biomass & Recruitment
Source: SouthEast Data, Assessment and Review 28, 2019

Timeline of Management Actions: FMP (2017); Amendment 1 (2019); Addendum I (2020)

Management Considerations
Condition: Two cobia stocks are currently recognized off the Atlantic coast; the Atlantic Migratory Group (Atlantic cobia) occurring from New York to Georgia, and the Gulf of Mexico Migratory Group (Gulf cobia) occurring throughout the Gulf of Mexico and extending to Florida’s east coast. Atlantic cobia is neither overfished nor experiencing overfishing. The 2019 SEDAR Benchmark Assessment utilized SSB_{F_{40\%}} as the overfished threshold and F_{40\%} as the overfishing threshold. SSB remains above the overfished threshold, but the fishing mortality rate has not exceeded the overfishing threshold.

Biological Reference Points from 2019 SEDAR Benchmark Assessment:
2017 SSB = 4,212 mt
SSB_{F_{40\%}} = 2,979 mt
2017 F = 0.17
F_{40\%} = 0.69

Primary Management Measures:
Amendment 1 (2019) establishes management measures that transition the FMP from complementary management with the Councils to sole management by the Commission. Amendment 1 establishes mechanisms to set harvest quotas and sector allocations, define stock status criteria, and recommend management
Overview of Stock Status
Cobia, *Rachycentron canadum*

measures to be implemented by NOAA Fisheries in federal waters. Due to the re-calibration of recreational data used in the 2019 assessment, the Board initiated an addendum to reevaluate allocation and *de minimis* measures.

In October 2020, the Board approved Addendum I to Amendment 1. The Addendum was initiated in response to the 2020 quota, which is based on the results of the 2020 Atlantic cobia benchmark stock assessment. The Addendum changed the allocation between commercial and recreational sectors, taking into consideration the change in recreational estimates. The addendum also adjusted the commercial quota closure trigger and *di minimis* recreational and commercial regulations.
Overview of Stock Status
Horseshoe Crab, *Limulus polyphemus*

FMP Status: FMP approved in 1998. Addendum I (2000) required states to cap harvest at 25% below the 1995-1997 levels and encouraged retention of more restrictive measures. Addendum II (2001) allowed state-to-state quota transfers. Addendum III (2004) capped annual harvest in NJ and DE at 150,000 crabs/state and set MD’s annual quota at its 2001 landings level (170,653 crabs); these states also prohibited bait harvest and landings from May 1 to June 7. Addendum IV (2006) established a male-only harvest of up to 100,000 crabs annually from June 8 to December 31 through September 2008 in NJ and DE, and set an annual closed season in MD waters from January 1 through June 7 through 2008. Addendum IV further restricted VA’s ocean harvest to no more than 40% of its quota and required that the sex ratio of the harvest comprise at least 2 to 1 males to females. Its provisions were extended to April 2013 through Addenda V & VI. Addendum VII (2012) implements the Adaptive Resource Management (ARM) framework that incorporates both shorebird and horseshoe crab abundance levels when considering the optimized horseshoe crab harvest level for the Delaware Bay area.

Primary Management Measures: Using the ARM Framework, the Board approved a 500,000 male-only crab harvest for the 2013-2020 fishing seasons. The harvest limit is allocated by state quota to the states which harvest horseshoe crabs of Delaware Bay origin (NJ, DE, MD, and VA).

Please note the following details regarding biomedical collection numbers:

* Biomedical collection numbers, which are annually reported to the Commission include all horseshoe crabs brought to bleeding facilities except those that were harvested as bait and counted against state quotas.
* Most of the biomedical crabs collected are returned to the water after bleeding; a 15% mortality rate is estimated for all bled crabs.

Timeline of Management Actions: FMP (1998); Addendum I (2000); Addendum II (2001); Addendum III (2004); Addendum IV (2006); Addendum V (2008); Addendum VI (2010); Addendum VII (2012)

Management Considerations

Condition: Unknown

FMP Stock Rebuilding Goals & Schedule: None
whole crab except for those individuals who can prove a history of claw landings in the states of New Jersey through Virginia. To prevent the fishery from being open access, the FMP states that participation in the trap fishery is limited to lobster permit holders or those who can prove a history of crab-only pot fishing. All others must obtain an incidental permit. In the recreational fishery, the FMP sets a possession limit of 50 whole crabs per person per day and prohibits the retention of egg-bearing females. To address a lack of data on the Jonah crab fishery, the FMP implements fishery-dependent data collection. The Plan requires both harvester and dealer reporting along with port and sea sampling.

Addendum I, approved in May 2016, establishes a bycatch limit of 1,000 crabs per trip for non-trap and non-lobster trap gear. In doing so, the Addendum caps incidental landings of Jonah crab across all non-directed gear types with a uniform bycatch allowance.

Addendum II establishes a coastwide standard for claw harvest to respond to concerns regarding the equity of the claw provision established in the FMP. The Addendum also establishes a definition of bycatch based on a percent composition of catch in order to minimize the expansion of a small-scale fishery under the bycatch allowance.

Addendum III addresses concerns regarding deficits in existing reporting requirements by expanding the mandatory harvester reporting data elements, improving the spatial resolution of harvester data, establishing a 5-year timeline for implementation of 100% harvester reporting, and prioritizing the development of electronic harvester reporting. In addition, the Addendum improves biological sampling requirements by establishing a baseline of ten sampling trips per year in the American lobster/Jonah crab fishery, and encourages states with more than 10% of coastwide landings in either the lobster or Jonah crab fisheries to conduct additional sampling trips.

**Timeline of Management Actions:** FMP ('15); Addendum I ('16); Addendum II ('17); Addendum III ('18)

**Management Considerations:**
Condition: Unknown

**FMP Stock Rebuilding Goals:** None.

**FMP Status:** The goals of the Interstate FMP (approved by the American Lobster Management Board in August 2015) are to promote conservation, reduce the possibility of recruitment failure, and allow full utilization of the resource by the industry. The plan lays out specific management measures in the commercial fishery, including a 4.75” minimum size with zero tolerance and a prohibition on the retention of egg-bearing females. The FMP also specifies the fishery be strictly
Overview of Stock Status
Northern Shrimp, *Pandalus borealis*

**Management Considerations:**
**Condition:** Depleted; abundance and biomass indices lowest on record; recruitment indices also very low

**FMP Stock Rebuilding Goals:** None

**FMP Status:** Amendment 3 is designed to improve management of the northern shrimp resource in the event the fishery reopens. The Amendment refines the FMP objectives and provides the flexibility to use the best available information to define the status of the stock and set the total allowable catch (TAC). Additionally, it implements a state-specific allocation program to better manage effort in the fishery; 80% of the annual TAC will be allocated to Maine, 10% to New Hampshire, and 10% to Massachusetts. Addendum I provides states the authority to allocate their state-specific quota between gear types in the event the fishery reopens.

A moratorium was instituted for the 2014-2018 fishing seasons to protect the remaining spawning population and reduce pressure on the collapsed stock. The Section extended the fishing moratorium through 2021 with the understanding that should recruitment improve, it would take several years for those shrimp to be commercially harvestable. The next stock assessment update is scheduled for 2021.

**Timeline of Management Actions:** FMP (1986); Amendment 1 (2004); Amendment 2 (2011); Addendum I (2012); Amendment 3 (2017); Addendum I (2018)

**Primary Management Measures:** Fishery specifications are set annually and primarily consist of seasonal closures, gear restrictions, and catch controls.
Overview of Stock Status
Red Drum, *Sciaenops ocellatus*

Timeline of Management Actions:
- FMP (1984)
- Amendment 1 (1991)
- Amendment 2 (2002)
- Addendum I (2013)

Management Considerations

**Condition:**
Northern (NJ-NC) and southern (SC-FL) stocks are assessed separately. Overfishing is not occurring in either stock, and no overfished status could be estimated due to data limitations on older fish. ASMFC has begun the next benchmark stock assessment with the first data workshop to occur in November 2020.

**FMP Stock Rebuilding Goals:**
- Fishing Mortality Threshold = $F$ at 30% static spawning potential ratio (SPR)
- Fishing Mortality Target = $F$ at 40% static SPR

**FMP Rebuilding Schedule:** None

**FMP Status:** SAFMC transferred management authority of red drum through Amendment 2, which aims to achieve a sufficient escapement rate and restore the age and size structure of the Atlantic coast population. Addendum I outlines habitat needs and concerns of the species.

November 2020
Overview of Stock Status
Red Drum, *Sciaenops ocellatus*

**Primary Management Measures:** All states have implemented recreational bag and size limits to attain the management goal of 40% SPR, including a maximum total length of 27 inches for all fisheries. States must maintain current or more restrictive commercial fishery regulations.

Red Drum Recreational Catch and Commercial Landings
Source: ACCSP Data Warehouse, 2019
Overview of Stock Status
Scup, Stenotomus chrysops

Timeline of Management Actions: FMP (1996); Amendment 13 (2002); Addendum IX (2003); Addenda XI & XIII (2004); Addendum XVI (2005); Amendment 14 (2007); Addendum XX (2009); Addendum XXIX (2017); Addendum XXXI (2018); Addendum XXXII (2018).

Management Considerations:
Condition: The 2019 scup operational assessment concluded that the scup stock was not overfished, and overfishing was not occurring in 2018 relative to the updated biological reference points calculated through the assessment.

Biological Reference Points from SAW/SARC 60 (2015):
Spawning Stock Biomass threshold (1/2 SSB_{MSY\_PROXY}) = 96.23 million pounds
Spawning Stock Biomass target = SSB_{MSY} = SSB_{40\%} = 192.47 million pounds
Spawning Stock Biomass_{2016} = 397 million pounds

Fishing Mortality Threshold (F_{MSY\_PROXY}=F_{40\%}) = 0.220
Fishing Mortality_{2016} = 0.139

Overview of Stock Status  
Scup, *Stenotomus chrysops*

recommended NOAA Fisheries implement transit provisions in Block Island Sound. Additionally, the Addendum expands the suite of tools available for managing summer flounder, scup and black sea bass, and reduces inconsistencies between state and federal regulations.

**Primary Management Measures:** Total annual quotas are divided between the recreational fishery (22%) and the commercial fishery (78%). Recreational fishery management measures are developed annually and include a combination of minimum size limits, bag limits, and fishing seasons. A coastwide quota regulates the winter period (October-April), while state-by-state quotas regulate the summer period (May-September). Specific management measures for the commercial fishery include minimum size limits, minimum mesh requirements for trawls, and closed seasons.

**Pending Actions:**
**Summer Flounder, Scup, and Black Sea Bass Commercial/Recreational Allocations Amendment**
In October 2019, the Board and the Council initiated the development of a joint amendment to reevaluate the FMP’s commercial and recreational allocations. This action aims to address the allocation-related impacts of the revised recreational catch and landings data provided by MRIP. The Draft Amendment is currently out for public comment until March 2021.
Overview of Stock Status
Shad & River Herring

Management Considerations:
Condition: Depleted on a coastwide basis, overfishing status unknown

FMP Stock Rebuilding Goals: Protect, enhance, and restore East Coast migratory spawning stocks of American shad, hickory shad, and river herring in order to achieve stock restoration and maintain sustainable levels of spawning stock biomass.

FMP Rebuilding Schedule: None.

FMP Status: Amendments 2 (River Herring Management) & 3 (American Shad Management) establish 2012 and 2013 moratoria unless sustainability can be documented.

Primary Management Measures:
Shad - Amendment 3 establishes a 2013 moratorium unless sustainability can be documented. Commercial ocean-intercept fishery for American shad is closed. Limited ocean bycatch of American shad is permitted. All jurisdictions shall not exceed an aggregate 10 fish daily creel limit in the recreational fisheries for hickory shad.

River Herring – Amendment 2 establishes a 2012 moratorium unless sustainability can be documented.

Timeline of Management Actions: FMP (1985); Amendment 1 (1999); Amendment 2 – River Herring (2009); Amendment 3 – American Shad (2010)

<sup>^</sup>NE shelf trends are from the spring, coastwide survey data which encounters river herring more frequently than the fall survey. A = Alewife only; B = Blueback herring only; A,B = Alewife and blueback herring by species; RH = alewife and blueback herring combined.
Overview of Stock Status
Spanish Mackerel, Scomberomorus maculatus

Management Considerations:
Condition: Rebuilt; Not overfished and overfishing is not occurring

FMP Stock Rebuilding Goals:
Biomass threshold = (1-M)*B_{MSY}
Fishing mortality threshold = F_{30\%SPR}

FMP Status: Complementary management with the SAFMC; FMP approved in 1990. The Omnibus Amendment to the FMPs for Spanish Mackerel, Spot, and Spotted Seatrout (2011) updates the Spanish Mackerel FMP with compliance measures and Commission standards, as well as modifies the Commission's management program to be consistent with federal management in the exclusive economic zone. The plan also provides mechanisms to review and track federal management changes. Addendum I (2013) modifies minimum size for select gear types and seasons.

Primary Management Measures: The annual catch limit (ACL) was set at 5.29 million pounds in the most recent Amendment 18 to the Federal FMP. The ACL is allocated on a 55/45 basis between the commercial and recreational fisheries. The commercial fishery is controlled mainly through an annual quota and trip limits, while the recreational fishery is primarily managed through a maximum bag limit of 15 fish and at least a minimum size limit of 12” fork length (between NY and FL and consistent with federal measures) or 14” total length. In addition, both Amendment 18 and the Omnibus Amendment include accountability measures for payback of overages if the total ACL is exceeded and the stock is overfished.

Timeline of Management Actions: FMP (1990); Omnibus Amendment (2011); Addendum I (2013)
**Overview of Stock Status**

**Spiny Dogfish, *Squalus acanthias***

January 2020

**Management Considerations**

**Condition:** Rebuilt; not overfished and overfishing is not occurring. Spawning stock biomass is estimated to be at 67% of the target at 235 million pounds.

**FMP Reference Points:**

Female SSB threshold (1/2 SSB max) = 79,644 mt (175 million pounds)  
Female SSB target (100% SSB max) = 159,288 mt (351 million pounds)  
Fishing Mortality Threshold ($F_{\text{threshold}}$) = 0.2439  
Fishing Mortality Target ($F_{\text{MSY}}$) = 0.2439

**FMP Status:** The 2002 FMP established annual quota and possession limit system; Addendum I allowed Board to set multi-year specifications; Addendum II established regional allocation of the annual quota with 58% to states from ME–CT; Addendum III established state shares for NY–NC; Addendum IV aligned the F threshold definition with the federal plan; and Addendum V prohibits processing at-sea, including the removal of fins.

**Primary Management Measures:** Spiny dogfish is managed under an annual quota with possession limits for the commercial fishery only, with, a commercial quota of 29.6 million pounds for the 2021/2022 and 2022/2023 fishing years, with a maximum possession limit of 6,000 pounds per day for the northern region states (ME-CT).

**Timeline of Management Actions:** Emergency Action (‘00); FMP (‘03); Addendum I (‘05); Addendum II (‘08); Addendum III (‘11); Addendum IV (‘12); Addendum V (‘14)

January 2020
Overview of Stock Status
Spot, *Leiostomus xanthurus*

Management Considerations
Condition: Unknown; The TLA was recently updated in 2020 to incorporate additional fishery-independent surveys, age and length information, an updated reference period, regional characteristics, and an updated management trigger mechanism. These changes will better represent trends in adult abundance of spot than previous methods.

FMP Stock Rebuilding Goals and Rebuilding Schedule: None

FMP Status: FMP approved in 1987. The Omnibus Amendment to the FMPs for Spanish Mackerel, Spot, and Spotted Seatrout (2011) updates the Spot FMP with compliance measures and Commission standards that were developed in response to the Atlantic Coastal Fisheries Cooperative Management Act (e.g., adaptive management, *de minimis* criteria). Addendum II established the TLA to assess stock trends and initiate management response. Addendum III updates the TLA’s management trigger mechanism, management responses to TLA triggers, and evaluation of the fishery’s response to measures implemented if triggers occur.

Primary Management Measures: Addendum II established the traffic light approach to assess stock trends and initiate management response, and Addendum III updated the TLA to add more surveys, regional measures, and outline management responses. Coastwide management actions are triggered if both characteristics (harvest and abundance) in either region exceed threshold levels of red for 2 of the 3 most recent years. In 2020, the actions were triggered at the moderate level of concern for the harvest metric in the Mid-Atlantic and South Atlantic regions, and for abundance in the Mid-Atlantic region.

**Timeline of Management Actions:** FMP (1987); Omnibus Amendment (2011); Addendum I (2014); Addendum III (2020).
Management Considerations
Condition: Unknown

FMP Stock Rebuilding Goals: Maintaining Spawning Potential Ratio (SPR) of at least 20%

FMP Rebuilding Schedule: None

FMP Status: FMP approved in 1984; Amendment I approved in 1991. The Omnibus Amendment to the Interstate Fishery Management Plans (FMPs) for Spanish Mackerel, Spot, and Spotted Seatrout, approved in August 2011, updates the Spotted Seatrout FMP with compliance measures and Commission standards that were developed in response to the Atlantic Coastal Fisheries Cooperative Management Act (e.g., adaptive management, de minimis criteria).

Primary Management Measures: Coastwide management measures, adopted in the Omnibus Amendment and implemented in July 2012, include a coastwide minimum size of 12 inches total length and comparable mesh size requirements. The Omnibus Amendment retained the goal of a 20% SPR. Florida’s Spotted Seatrout FMP has a goal of 35% SPR, while North Carolina, South Carolina, and Georgia have adopted the ASMFC’s recommended goal of 20% SPR.

Timeline of Management Actions: FMP (1985); Amendment 1 (1991); Omnibus Amendment (2011)
**Overview of Stock Status**

**Summer Flounder, Paralichthys dentatus**

**Timeline of Management Actions:** FMP (‘82); Amendment 13 (‘03); Addenda VIII & XV (‘04); Addenda XVI & XVII (‘05); Addendum XVIII (‘06); Addendum XIX (‘07); Addendum XXV (‘14); Addendum XXVI (‘15); Addendum XXVII (‘16); Addendum XXVIII (‘17); Addendum XXXI (‘18); Addendum XXXII (‘18); Summer Flounder Commercial Issues Amendment (‘19)

**Management Considerations:**

**Condition:** Rebuilt; not overfished but overfishing is occurring. Currently, F = 0.39; SSB = 79.9 million pounds (2018)

**FMP Stock Rebuilding Goals:**

SSB Target = 137.6 million pounds  
Fishing Mortality Threshold = 0.309  
SSB Threshold = 68.8 million pounds

**Primary Management Measures:** Annual total allowable landings (TAL) divided into a state-by-state commercial quota (60% of TAL) and recreational harvest limit (40% of TAL). Coastwide commercial management measures include minimum fish and mesh sizes. Recreational bag/size limits and seasons are determined on a state-by-state basis using conservation equivalency.
Overview of Stock Status
Summer Flounder, *Paralichthys dentatus*

Pending Actions:

*Summer Flounder, Scup, and Black Sea Bass Commercial/Recreational Allocations Amendment*

In October 2019, the Board and the Council initiated the development of a joint amendment to reevaluate the FMP’s commercial and recreational allocations. This action aims to address the allocation-related impacts of the revised recreational catch and landings data provided by MRIP. The Draft Amendment is currently out for public comment until March 2021.
Management Considerations:
Condition: The stock is overfished and overfishing is occurring coastwide (based on the 2016 stock assessment update). The Technical Committee also conducted assessment updates in four regions to account for limited north-south migration and regional harvest patterns of the species.

FMP Stock Rebuilding Goals (as proposed by 2016 assessment update and used in Amendment 1): See accompanying table

FMP Status: Amendment 1 established regional F_target for 2018 and beyond. All states in the management unit are required to implement measures to achieve their respective F_target, though there is no consistent schedule required to achieve those targets. However, if the current fishing mortality exceeds the regional threshold, the Board must initiate corrective action within one year. A stock rebuilding schedule can be established via an addendum. All states will implement the commercial tagging program by January 1, 2020.

Primary Management Measures: Tautog is managed as four regional stocks: Massachusetts – Rhode Island, Long Island Sound, New Jersey – New York Bight, and Delaware – Maryland – Virginia. Under Amendment 1, the four regions will implement measures to achieve the regional fishing mortality target with at least a 50% probability. Additionally, the Amendment establishes a commercial harvest tagging program to address an illegal, unreported and undocumented fishery.
Overview of Stock Status
Weakfish, *Cynoscion regalis*

**Management Considerations:**

**Condition:** Depleted, overfishing not occurring

**FMP Stock Control Rules:**

SSB Threshold = 20% Maximum Spawning Potential (MSP; i.e., SSB that is 20% of an unfished stock)

SSB Target = 30% MSP (i.e., SSB that is 30% of an unfished stock)

**FMP Rebuilding Schedule:** 6-year rebuilding period if SSB falls below the threshold level in any given year.

**FMP Status:** Amendment 4 (2002) established overfishing and overfished definitions, provided alternative recreational management options, and increased the commercial bycatch limit. Addendum I (2005) replaced Amendment 4’s biological sampling program. Addendum II (2007) implemented several measures (i.e., reduced creel and bycatch limits, landings triggers) to control expansion of the fishery in the event that stock status improved. Addendum III (2007) altered the bycatch reduction device certification requirements for consistency with the SAFMC’s Shrimp FMP. In response to the 2009 stock assessment, Addendum IV (2009) implemented a one fish recreational creel limit, 100 pound commercial trip and bycatch limits, and a 100 undersized fish allowance for finfish trawls, in addition to all previous measures. The addendum also replaced the fishing mortality reference points with percentage-based spawning stock biomass reference points.

**Primary Management Measures:** The commercial fishery is controlled through minimum size limit, trip limit, closed season, closed area, mesh size, bycatch limit, and bycatch reduction device requirements. The recreational fishery is managed through bag limit and minimum size limit requirements.

**Timeline of Management Actions:** FMP (1985); Amendment 1 (1992); Amendment 2 (1994); Amendment 3 (1996); Amendment 4 (2002); Addendum I (2005); Addenda II & III (2007); Addendum IV (2009)
Overview of Stock Status

July 2019
Overview of Stock Status
Winter Flounder, *Pseudopleuronectes americanus*

**SOUTHERN NEW ENGLAND/MID-ATLANTIC STOCK (SNE/MA)**

**Management Considerations:**

Condition: Overfished and overfishing is not occurring. Stock is at 32% of target SSB.

**SNE/MA Stock Reference Points:**

- $F_{MSY} = 0.286$
- $MSY (mt) = 3,915$
- $SSB \text{ Target} (B_{MSY}) (mt) = 12,261$
- $SSB \text{ Threshold} (\frac{1}{2}SSB_{MSY}) (mt) = 6,130.5$
- $SSB (mt) = 3,959$

**GULF OF MAINE STOCK (GOM)**

**Management Considerations:**

Condition: Stock biomass status is unknown and overfishing is not occurring.

**GOM FMP Stock Reference Points:**

- $E_{MSY} = 0.23$

**Timeline of Management Actions:** FMP & Addendum I (’92); Addendum II (’98); Amendment 1 (’05); Addendum I (’09); Addendum II (’12); Addendum III (’13)

**Primary Management Measures:**

Winter flounder are managed as two separate stocks in state waters: Southern New England/Mid-Atlantic (SNE/MA) and Gulf of Maine (GOM), with commercial and recreational specifications set by the Board (Addendum III, 2013). In 2021, the Board maintained commercial and recreational management measures for the GOM and SNE/MA stocks. Currently, the possession limit for non-federally permitted commercial fishermen is 500 lbs per trip in the GOM (Addendum II, 2012) and 50 lbs or 38 fish in SNE/MA. Gear requirements mandate use of a minimum 6.5” square or diamond mesh in the cod-end. Recreational measures include possession limits and seasons. In the GOM, recreational measures include an eight fish bag limit and 12” size limit. Recreational measures for the SNE/MA include a two fish bag limit and a 12” size limit, with an open season March-December.

---

January 2021
