REVIEW OF THE
ATLANTIC STATES MARINE FISHERIES COMMISSION
FISHERY MANAGEMENT PLAN FOR
BLUEFISH
(Pomatomus saltatrix)
2010 FISHING YEAR

Prepared by:
Mike Waine (ASMFC)

Bluefish Plan Review Team
Mike Waine, Chair
Wilson Laney

Accepted August 17, 2011
REVIEW OF THE INTERSTATE FISHERY MANAGEMENT PLAN
FOR BLUEFISH (Pomatomus saltatrix)

I. Status of the Fishery Management Plan

Date of FMP Approval: March 1990
Amendments: Amendment 1 (October 1998)
Management Unit: Migratory stocks of bluefish in the U.S. waters of the western Atlantic Ocean and state waters (Maine through Florida)
States with Declared Interest: Maine through Florida, excluding Pennsylvania and the District of Columbia
Active Committees: ASMFC Bluefish Management Board, MAFMC Coastal Migratory Species Committee, Technical Committee, Plan Review Team, and Stock Assessment Subcommittee

The bluefish fishery management plan (FMP) was adopted by the Atlantic States Marine Fisheries Commission (ASMFC) and the Mid-Atlantic Fishery Management Council (MAFMC) in October 1989. It is a joint management plan and is the first FMP developed jointly by an interstate commission and a federal fishery management council.

Bluefish is currently managed under Amendment 1 to the FMP approved in October 1998 and implemented in 2010. The goal of the Amendment is to conserve the bluefish resource along the Atlantic coast, specifically:

1. Increase understanding of the stock and fishery
2. Provide highest availability of bluefish to U.S. fishermen while maintaining, within limits, traditional uses of bluefish
3. Provide for cooperation among the coastal states, the various regional marine fishery management councils, and federal agencies involved along the coast to enhance the management of bluefish throughout its range
4. Prevent recruitment overfishing
5. Reduce the waste in both the commercial and recreational fisheries.

States with a declared interest in the bluefish FMP include all member states, with the exception of Pennsylvania and the District of Columbia. Management issues are addressed through the ASMFC Bluefish Management Board and the MAFMC Coastal Migratory Species Committee. The ASMFC Bluefish Technical Committee provides technical advice. A joint ASMFC-MAFMC Technical Monitoring Committee conducts annual plan monitoring, which is reviewed by a joint Advisory Panel, and recommendations are provided to the Board. The ASMFC Stock Assessment Subcommittee addresses stock assessment matters.
II. **Status of the Stock**

The most recent ASMFC bluefish stock assessment was completed in 2005. The assessment passed peer review and was approved by the ASMFC Bluefish Management Board and the MAFMC Coastal Migratory Species Committee. The assessment developed biological reference points for both bluefish biomass and fishing mortality ($\frac{1}{2}B_{MSY} = 73,526$ mt; $F_{MSY} = 0.19$). The ASAP model used to calculate population abundance in this assessment has been updated annually since 2005. The output from this model is used to set the annual Total Allowable Catch (TAC).

The most recent stock status information indicates that bluefish are not overfished and overfishing is not occurring. The biomass estimates in 2008 exceeded the $B_{MSY}$ and therefore bluefish were considered rebuilt two years ahead of the 2010 rebuilding deadline. The 2011 stock assessment update suggests that total biomass in 2010 was 95% of its target. For 2010, fishing mortality rates estimated in ASAP using state and federal indices show a low fishing mortality and a stable trend in population biomass ($B_{2010} = 140,297$ MT; $F_{2010} = 0.14$). Abundance estimates peaked in 1982 at 166 million fish, but declined to 58 million in the mid-1990s. Since 1997 abundance has generally increased to a high of 99.88 million fish in 2008, although since then, abundance estimates declined to 72.18 million fish in 2010.

III. **Status of the Fishery**

Recreational catch of bluefish has averaged 18.33 million pounds since 1981. In 2010, recreational anglers along the Atlantic Coast caught 15.803 million bluefish, a 24% increase from 2009. Recreational harvest has been increasing since a low of 3.7 million fish in 1999. Since then, recreational harvest averaged over 7.05 million fish annually. In 2010, 6.1 million bluefish were harvested in the recreational fishery. The majority of recreational activity occurred from May to October, with the peak activity in September and October.

Landings from the commercial bluefish fishery have been consistently lower than the recreational catch. Commercial landings decreased from 16.5 million pounds in 1981 to 7.3 million pounds in 1999. Commercial landings have been regulated by quota since implementation of Amendment 1 in 2000 and since then have averaged 7.17 million pounds annually. The landings estimates for 2010 is 7.07 million pounds, which is a 1% increase from 2009. The majority of the harvest (~76%) came from New York, New Jersey and North Carolina.

V. **Status of Research and Monitoring**

Many states, NMFS, and SEAMAP conduct fishery-independent surveys. New Hampshire, Massachusetts, Connecticut, New York, New Jersey, Delaware, Maryland, and Florida monitor juvenile abundance. Rhode Island, Connecticut, New Jersey, Delaware, North Carolina, South Carolina, Georgia, and Florida monitor adult abundance. Year class strength is monitored through the NMFS autumn trawl survey.
Commercial landings information is collected by most states from dealer or fisherman reporting programs. Fishermen in the EEZ are required to report their landings to the NMFS. North Carolina and Virginia are the only states that significantly sample bluefish commercial fisheries for size and age composition of the catch. A bluefish ageing workshop conducted in 2011 indicated the need for coast wide sampling to obtain bluefish age data for the stock assessment. Recreational harvest is monitored by the Marine Recreational Fisheries Statistics Survey.

VI. Status of Management Measures and Issues

The ASMFC and MAFMC adjust the quota and harvest limit annually using the specification setting process detailed in Amendment 1. The recreational fishery is allocated 83% of the entire quota. Coastwide, the commercial fishery is limited to 17% of the total allowable landings each year. The commercial quota can be increased (but not to exceed 10.5 millions pounds) if it is anticipated that the recreational fishery will not land their entire allocation for the upcoming year. The coastwide commercial quota is divided into individual state-by-state quotas based on landings from 1981-1989.

The Technical Monitoring Committee is responsible for reviewing the best available data and recommending an annual commercial quota and recreational possession limit. Based on the 2009 stock assessment update the Commission and the Council approved the Monitoring Committee recommendation of a total allowable landings (TAL) of 29.26 million pounds for 2010. Additionally, the Commission and the Council recommended a transfer of 5,387,000 pounds from the recreational sector to the commercial sector to achieve a commercial quota of 10,213,222 pounds and a recreational harvest limit of 18,630,842 pounds.

VII. Current State-by-State Implementation of FMP Compliance Requirements

These states or jurisdictions are required to comply with the provisions of the Bluefish FMP: Maine, New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Delaware, Maryland, Potomac River Fisheries Commission, Virginia, North Carolina, South Carolina, Georgia, and Florida. The following are specific FMP compliance requirements:

- Each state must restrict the possession of bluefish by anglers to not more than fifteen fish per day, or have an ASMFC-approved equivalent conservation program.
- Each state must restrict its commercial fishery to the quota adopted under procedures specified in the FMP.

The final compliance criteria include:
- Monitoring requirements for the commercial fishery
- Commercial and party/charter vessel permitting requirements
- Dealer permitting requirements
- Annual compliance reporting

The Chair of the Plan Review Team has reviewed all of the compliance reports and recommends that each state be found in compliance with respect to implementing the recreational bag limit and limiting their commercial fishery to their state quota.
South Carolina and Georgia have requested *de minimis* status for 2011. The Chair of the Plan Review Team finds that the State of South Carolina and the State of Georgia qualify for *de minimis* status because their commercial landings from the most recent year were less than 0.1% of the coastwide commercial landings.

VIII. **Prioritized Research Needs**

1. Collect size, otoliths and age composition of the fisheries by gear type and statistical area. Focus age sampling on as wide a range of sizes as possible.
2. Target commercial and recreational landings for biological data collection when possible.
3. Initiate fisheries-dependent and independent sampling of offshore populations of bluefish during the winter months.
4. Age any archived age data for bluefish and use the data to supplement age keys.
5. Test the sensitivity of the bluefish assessment to assumptions concerning age-varying M, level of age-0 discard, and selection patterns.
6. Evaluate amount and length frequency of discards from the commercial and recreational fisheries.
7. Continue work on catch and release mortality.
8. Increase intensity of biological sampling of the NER commercial and coastwide recreational fisheries.
9. Conduct research to determine the timing of sexual maturity and fecundity of bluefish.
10. Study tag mortality and retention rates for ALS dorsal loop and other tags used for bluefish.
11. Initiate research on species interactions and predator-prey relationships.
12. Initiate a coastal surf-zone seine study to provide more complete indices of juvenile abundance.
13. Investigate the long term, synergistic effects of combinations of environmental variables on various biological and sociological parameters such as reproductive capability, genetic changes, and suitability for human consumption.
14. Conduct studies on the interactive effects of pH, contaminants, and other environmental variables on survival of bluefish.
Table 1. Estimated number of bluefish caught (A + B1 + B2, by count) and the estimated number of bluefish harvested (A + B1, by count) by marine recreational fishermen each year, 1981 to 2010. Source: MRFSS
