## ATLANTIC STATES MARINE FISHERIES COMMISSION

## REVIEW OF THE INTERSTATE FISHERY MANAGEMENT PLAN

FOR ATLANTIC STRIPED BASS
(Morone saxatilis)

## 2018 FISHING YEAR

Prepared by the Plan Review Team
Approved by the Atlantic Striped Bass Management Board

## I. Status of the Fishery Management Plan

Date of FMP Approval:
Amendments:

Original FMP - 1981
Amendment 1-1984
Amendment 2-1984
Amendment 3-1985
Amendment 4 - 1989; Addendum I - 1991, Addendum II - 1992,
Addendum III - 1993, Addendum IV - 1994
Amendment 5 - 1995; Addendum I - 1997, Addendum II - 1997,
Addendum III - 1998, Addendum IV - 1999, Addendum V - 2000
Amendment 6-2003; Addendum I - 2007, Addendum II - 2010,
Addendum III - 2012, Addendum IV - 2014
Management Unit:

States With Declared Interest:
Additional Jurisdictions:

Active Boards/Committees:
Migratory stocks of Atlantic striped bass from Maine through North Carolina

Maine - North Carolina, including Pennsylvania
District of Columbia, Potomac River Fisheries Commission, National Marine Fisheries Service, United States Fish and Wildlife Service

Atlantic Striped Bass Management Board, Advisory Panel, Technical Committee, Stock Assessment Subcommittee, Tagging Subcommittee, Plan Review Team, and Plan Development Team

The Atlantic States Marine Fisheries Commission (Commission) developed a Fisheries Management Plan (FMP) for Atlantic Striped Bass in 1981 in response to poor juvenile recruitment and declining landings. The FMP recommended increased restrictions on commercial and recreational fisheries, such as minimum size limits and harvest closures on spawning grounds. Two amendments were passed in 1984 recommending additional management measures to reduce fishing mortality. To strengthen the management response and improve compliance and enforcement, the Atlantic Striped Bass Conservation Act (P.L. 98-613) was passed in late 1984. The Striped Bass Act ${ }^{1}$ mandated the implementation of striped bass regulations passed by the Commission and gave the Commission authority to recommend to the Secretaries of Commerce and Interior that states be found out of compliance when they failed to implement management measures consistent with the FMP.

The first enforceable plan under the Striped Bass Act, Amendment 3, was approved in 1985, and required size regulations to protect the 1982-year class - the first modest size cohort since the previous decade. The objective was to increase size limits to allow at least $95 \%$ of the females in the 1982 year class to spawn at least once. Smaller size limits were permitted in producer areas than along

[^0]the coast. Several states, beginning with Maryland in 1985, opted for a more conservative approach and imposed a total moratorium on striped bass landings for several years. The amendment contained a trigger mechanism to relax regulations when the 3 -year moving average of the Maryland juvenile abundance index (JAI) exceeded an arithmetic mean of 8.0 - which was attained with the recruitment of the 1989 year class. Also, in 1985, the Commission determined the Albemarle Sound-Roanoke River (A-R) stock in North Carolina contributed minimally to the coastal migratory population, and was therefore allowed to operate under an alternative management program.

Amendment 4, implemented in 1989, aimed to rebuild the resource rather than maximize yield. The amendment allowed state fisheries to reopen under a target fishing morality ( $F$ ) of 0.25 , which was half the estimated $F$ needed to achieve maximum sustainable yield (MSY). The amendment allowed an increase in the target $F$ once spawning stock biomass (SSB) was restored to levels estimated during the late 1960s and early 1970s. The dual size limit concept was maintained (coastal versus producer areas), and a recreational trip limit and commercial season was implemented to reduce the harvest to $20 \%$ of that in the historic period of 1972-1979. A series of four addenda were implemented from 1990-1994 to maintain protection of the 1982 year class.

In 1990, to provide additional protection to striped bass and ensure the effectiveness of state regulations, NOAA Fisheries passed a final rule (55 Federal Register 40181-02) prohibiting possession, fishing (catch and release fishing), harvest, and retention of Atlantic striped bass in the Exclusive Economic Zone (EEZ), with the exception of a defined transit zone within Block Island Sound. Atlantic striped bass may be transported through this defined area provided that the vessel is not used to fish while in the EEZ and the vessel remains in continuous transit, and that the fish were legally caught in adjoining state waters.

In 1995, the Atlantic striped bass migratory stock was declared recovered by the Commission (the $A / R$ stock was declared recovered in 1997) and Amendment 5 was adopted to increase the target $F$ to 0.33 , midway between the existing $F$ target ( 0.25 ) and $F_{\text {Msy. Target }} F$ was allowed to increase again to 0.40 after two years of implementation. Regulations were developed to achieve the target $F$ (which included measures to restore commercial harvest to 70\% of the average landings during the 1972-1979 historical period) and states were allowed to submit proposals to implement alternative regulations that were deemed conservationally equivalent to the Amendment 5 measures. From 1997-2000, a series of five addenda were implemented to respond to the latest stock status information and adjust the regulatory program to achieve each change in target $F$.

In 2003, Amendment 6 was adopted to address five limitations within the existing management program: 1) potential inability to prevent the Amendment 5 exploitation target from being exceeded; 2) perceived decrease in availability or abundance of large striped bass in the coastal migratory population; 3) a lack of management direction with respect to target and threshold biomass levels; 4) inequitable effects of regulations on the recreational and commercial fisheries, and coastal and
producer area sectors; and 5) excessively frequent changes to the management program. Accordingly, Amendment 6 completely replaced the existing FMP for Atlantic striped bass. ${ }^{2}$

The goal of Amendment 6 is "to perpetuate, through cooperative interstate management, migratory stocks of striped bass; to allow commercial and recreational fisheries consistent with the long-term maintenance of a broad age structure, a self-sustaining spawning stock; and also to provide for the restoration and maintenance of their essential habitat." In support of this goal, the following objectives are included:

1. Manage striped bass fisheries under a control rule designed to maintain stock size at or above the target female spawning stock biomass level and a level of fishing mortality at or below the target exploitation rate.
2. Manage fishing mortality to maintain an age structure that provides adequate spawning potential to sustain long-term abundance of striped bass populations.
3. Provide a management plan that strives, to the extent practical, to maintain coastwide consistency of implemented measures, while allowing the States defined flexibility to implement alternative strategies that accomplish the objectives of the FMP.
4. Foster quality and economically viable recreational, for-hire, and commercial fisheries.
5. Maximize cost effectiveness of current information gathering and prioritize state obligations in order to minimize costs of monitoring and management.
6. Adopt a long-term management regime that minimizes or eliminates the need to make annual changes or modifications to management measures.
7. Establish a fishing mortality target that will result in a net increase in the abundance (pounds) of age 15 and older striped bass in the population, relative to the 2000 estimate.

Amendment 6 modified the F target and threshold, and introduced a new set of biological reference points (BRPs) based on female SSB, as well as a list of management triggers based on the BRPs. The coastal commercial quotas were restored to $100 \%$ of the states' average landings during the 19721979 historical period, except for Delaware's coastal commercial quota which remained at the level allocated in $2002^{3}$. In the recreational fisheries, all states were required to implement a two-fish bag limit with a minimum size limit of 28 inches, except for the Chesapeake Bay fisheries, North Carolina fisheries that operate in the $A / R$, and states with approved alternative regulations. The Chesapeake Bay and $A / R$ regulatory programs were predicated on a more conservative $F$ target than the coastal migratory stock, which allowed these states/jurisdictions (hereafter states) to implement separate seasons, harvest caps, and size and bag limits as long as they remain under that F target. No minimum size limit can be less than 18 inches under Amendment 6. The same minimum size standards regulate

[^1]the commercial fisheries as the recreational fisheries, except for a minimum 20 inch size limit in the Delaware Bay spring American shad gillnet fishery.

States are permitted the flexibility to deviate from these regulations by submitting conservation equivalency proposals to the Plan Review Team (PRT). All proposals are subject to technical review and approval by the Atlantic Striped Bass Management (Board). It is the responsibility of the state to demonstrate through quantitative analysis that the proposed management program is equivalent to the standards in the FMP, or will not contribute to the overfishing of the resource.

Four addenda to Amendment 6 have been implemented. Addendum I, approved in 2007, established a bycatch monitoring and research program to increase the accuracy of data on striped bass discards and recommended development of a web-based angler education program. Also in 2007, President George W. Bush issued an Executive Order (E.O. 13449) prohibiting the sale of striped bass (and red drum) caught within the EEZ. Addendum II was approved in 2010 and established a new definition of recruitment failure such that each index would have a fixed threshold rather than a threshold that changes annually with the addition of each year's data. Addendum III was approved in 2012 and requires all states with a commercial fishery for striped bass to implement a uniform commercial harvest tagging program. The addendum was initiated in response to significant poaching events in the Chesapeake Bay and aims to limit illegal harvest of striped bass.

Addendum IV, approved in 2014, currently sets the regulatory program for striped bass fisheries. The addendum was initiated in response to the 2013 benchmark assessment which indicated a steady decline in SSB since the mid-2000s. The addendum established new F reference points, as recommended by the 2013 benchmark. In order to reduce $F$ to a level at or below the new target, coastal states are required to implement 1-fish bag limit and 28 " minimum size limit to achieve a $25 \%$ reduction from 2013 removals in the ocean fishery. Chesapeake Bay fisheries are required to implement regulations to achieve a $20.5 \%$ reduction from 2012 removals since their fisheries were reduced by $14 \%$ in 2013 based on their management program. The addendum maintains the flexibility to implement alternative regulations through the conservation equivalency process. This practice has resulted in a variety of regulations among states (Table 1 and Table 2). All states promulgated regulations prior to the start of their 2015 seasons.

In February 2017, the Board initiated the development of Draft Addendum V to consider liberalizing coastwide commercial and recreational regulations. The Board's action responded to concerns raised by Chesapeake Bay jurisdictions regarding continued economic hardship endured by its stakeholders since the implementation of Addendum IV and information from the 2016 stock assessment update indicating that F was below target in 2015, and that total removals could increase by $10 \%$ to achieve the target F. However, the Board chose to not advance the draft addendum for public comment largely due to harvest estimates having increased in 2016 without changing regulations. Instead, the Board decided to wait until it reviews the results of the 2018 benchmark stock assessment before considering making changes to the management program.

## II. Status of the Stocks

The 2018 benchmark stock assessment for Atlantic striped bass was peer-reviewed at the $66^{\text {th }}$ Northeast Regional Stock Assessment Workshop (SAW)/Stock Assessment Review Committee (SARC) meeting in November 2018. The assessment addressed several of the recommendations from the $57^{\text {th }}$ SAW/SARC, including developing new maturity-at-age estimates for the coastal migratory stock and evaluating stock status definitions relative to uncertainty in biological reference points. The assessment also made progress on developing a spatially and temporally explicit catch-at-age model incorporating tag-based movement (migration) information. Although the Peer Review Panel did not accept the migration model for management use, it recommended continued work to improve the model for future assessments.

The accepted model is a forward projecting statistical catch-at-age (SCA) model which uses catch-atage data and fishery-dependent and -independent survey indices to estimate annual population size and fishing mortality. Indices of abundance track relative changes in the population over time while catch data provide information on the scale of the population size. Age structure data (numbers of fish by age) provide additional information on recruitment (number of age-1 fish entering the population) and trends in mortality.

The biological reference points (BRPs) currently used for management are based on the 1995 estimate of female spawning stock biomass (SSB). The 1995 estimate of female SSB is used as the SSB threshold because many stock characteristics (such as an expanded age structure) were reached by this year and the stock was declared recovered. The SSB target is equal to $125 \%$ of SSB threshold. To estimate the associated fishing mortality ( $F$ ) threshold and target, population projections were made by using a constant F and changing the value until the SSB threshold or target was achieved. For the 2018 benchmark, the BRP values have been updated. The benchmark incorporates the newly calibrated recreational catch estimates based on the Marine Recreational Information Program's (MRIP) Fishing Effort Survey (FES), resulting in higher estimates of SSB and therefore higher estimates for the SSB threshold and target (refer to Section III for more information). The SSB threshold is estimated at 91,436 metric tons ( 202 million pounds), with an SSB target of 114,295 metric tons ( 252 million pounds). The new MRIP estimates did not have a large effect on the estimates of fishing mortality, and the updated $F$ threshold and target values are very similar to the previous $F$ reference points. The $F$ threshold is estimated at 0.24 , and the target is estimated at 0.20

Based on the results of the 2018 benchmark, Atlantic striped bass is overfished and experiencing overfishing. In 2017, female SSB was estimated at 68,476 metric tons ( 151 million pounds) which is below the SSB threshold (Figure 1). Female SSB declined steadily since the time series high in 2003 and has been below threshold since 2013. The recent decline in female SSB appears to be attributed to a period of low recruitment since about 2005 (Figure 1). However, the 2011, 2014, and 2015 year classes (representing the 2012, 2015, and 2016 age-1 recruitment estimates) were above average. Total F was estimated at or above $F$ threshold in 13 of the last 15 years, and was estimated above threshold in 2017 at 0.31 (Figure 2).

## III. Status of the Fishery in the Ocean and Chesapeake Bay

In 2018, total Atlantic striped bass removals (commercial and recreational, including harvest, commercial discards and recreational release mortality) was estimated at 5.78 million fish, which is an $18 \%$ decrease relative to 2017 (Table 3; Figure 5). The recreational sector accounted for $88 \%$ of total removals by number. It should be noted that the recreational catch estimates reported here reflect the new, improved MRIP mail-based survey and are not directly comparable to past FMP Review reports.

The commercial fishery harvested 4.71 million pounds ( 622,451 fish) in 2018 , which is a $2 \%$ increase by number but a $2 \%$ decrease by weight relative to 2017 (Table 4; Table 5). Harvest from Chesapeake Bay accounted for $65 \%$ of the total by weight; Maryland landed 32\%, Virginia landed 23\%, and PRFC landed $10 \%$ (Table 5; Figure 6). Additional harvest came from Massachusetts (16\%), New York (13\%), Rhode Island (4\%), and Delaware (3\%). The proportion of total harvest coming from Chesapeake Bay in numbers of fish is much higher; roughly $80 \%$ annually since 1990 (Table 6). This is because fish harvested in Chesapeake Bay have a lower average weight per fish than fish harvested in ocean fisheries. Commercial dead discards were estimated at 90,092 fish, and account for $2 \%$ of total removals in 2018 (Table 6).

Total recreational catch (harvest and releases) was estimated at 33.7 million fish which is an $18 \%$ decrease from 2017 and is likely attributed to the observed decrease in fishing effort for trips targeting striped bass in the ocean (Table 7). Total recreational harvest (A+B1) in 2018 is estimated at 2.24 million fish ( 23.1 million pounds), and represents a $23 \%$ decrease relative to 2017 ( $39 \%$ decrease by weight) (Table 8; Table 9). Maryland landed the largest proportion of recreational harvest in number of fish ${ }^{4}$ (44\%), followed by New Jersey (21\%), Massachusetts (17\%), New York (8\%), and Connecticut (4\%) (Table 9). The proportion of recreational harvest in numbers from Chesapeake Bay has increased in recent years and was estimated at 47\% in 2018.

The vast majority ( $89 \%$ on average since 1990) of recreational striped bass catch is released alive either due to angler preference or regulation (i.e., undersized or already caught the bag limit) (Figure 7). The assessment assumes, based on previous studies, that $9 \%$ of the fish that are released alive die as a result of being caught. In 2018, recreational anglers caught and released an estimated 31.4 million fish ( $93 \%$ of total catch), 2.8 million of which are were assumed to have died (Table 7). This represents a $17 \%$ decrease relative to 2017. The ocean region accounted for majority of the decrease and is likely attributed to the observed decrease in fishing effort in 2018. According to MRIP, the number of fishing trips where the angler identified striped bass as the primary or secondary target species in 2018 was 18.3 million trips which is a $6 \%$ decrease relative to 2017 ( 19.4 million trips) in the ocean region, while effort in Chesapeake Bay remained constant at roughly 2.6 million trips targeting striped bass.

[^2]
## IV. Albemarle Sound and Roanoke River Management Area

## Fishery Management Plan

While striped bass in North Carolina's ocean waters are managed under the Interstate FMP, Addendum IV to Amendment 6 formally defers management of the A/R stock to the state of North Carolina using A/R stock-specific BRPs approved by the Board (NCDMF 2013, 2014).

Estuarine striped bass in North Carolina are currently managed under Amendment 1 to the North Carolina Estuarine Striped Bass Fishery Management Plan (FMP) and its subsequent revision and recent supplement (NCDMF 2013, 2014, 2019). It is a joint plan between the North Carolina Marine Fisheries Commission (NCMFC) and the North Carolina Wildlife Resources Commission (NCWRC). Amendment 1, adopted in 2013, lays out separate management strategies for the Albemarle Sound-Roanoke Rive (AR) stock and the estuarine (non-migratory) Central and Southern striped bass stocks in the Tar-Pamlico, Neuse, and Cape Fear rivers. Management programs in Amendment 1 utilize annual total allowable landings (TAL), daily possession limits, open and closed harvest seasons, gill net mesh size and yardage restrictions, seasonal attendance requirements, barbless hook requirements in some areas, minimum size limits, and slot limits to maintain a sustainable harvest and reduce regulatory discard mortality in all sectors. Amendment 1 also maintains the stocking regime in the central and southern systems and the harvest moratorium on striped bass in the Cape Fear River and its tributaries (NCDMF 2013). Striped bass fisheries in the Atlantic Ocean of North Carolina are managed under ASMFC's Amendment 6 and subsequent addenda to the Interstate FMP for Atlantic Striped Bass. Amendment 6 also requires North Carolina to inform the Commission of changes to striped bass management in the A-R System.

## Albemarle Sound-Roanoke River Striped Bass Stocks

The most recent A/R benchmark stock-specific assessment utilized the ASAP3 statistical catch-at-age model. The model was peer reviewed by an outside panel of experts and approved for management use by the Board in October 2014. The benchmark assessment produced new BRPs and annual harvest quota to prevent overfishing. The model was most recently updated in 2016 with catch and index data through 2014 (Flowers and Godwin 2016). Based on results of the 2016 update, and in comparison to the BRPs below, A-R striped bass are not overfished and are not experiencing overfishing.

|  | $\boldsymbol{F}$ | Female SSB | Total Allowable Landings (TAL) |
| :--- | :---: | :---: | :---: |
| Threshold | 0.41 | $785,150 \mathrm{lbs}$. | $275,000 \mathrm{lb}$ (split evenly between <br> recreational and commercial sectors) |
| Target | 0.33 | $969,496 \mathrm{lbs}$. | recrinn |

In 2014, female SSB was estimated at 2,024,583 pounds which is above the peak in 2003 and the highest value in the time series (Figure 3). In 2014, F was estimated at 0.06 which is below both the $F$ threshold and target (Figure 4). Caution should be used, however, when evaluating the estimates of SSB and F in the terminal year. The estimated SSB value in 2014 is likely an overestimate based on past years of retrospective bias exhibited by the model. Subsequent assessments, incorporating additional years of data, and possibly a revised stock-recruit relationship, will likely reduce the magnitude of the 2014 value (Flowers and Godwin 2016). A/R striped bass experienced a period of unusually strong
recruitment (number of age-1 fish entering the population) from 1994-2001 followed by a period of lower recruitment from 2002-2014 (Figure 3).

Overall, the trends in the A/R stock abundance are quite similar to the Atlantic striped bass stocks described above, with a steady decline in female SSB since about 2003. Total stock abundance reached its peak in the early 2000s, declined gradually through about 2009 and increasing slightly beginning in 2011 through the terminal year. A new benchmark A/R stock assessment with data through 2016 is currently underway and scheduled to be completed in late 2019.

## Albemarle Sound and Roanoke River Atlantic Striped Bass Fisheries

In 2018, total commercial and recreational harvest in the Albemarle Sound Management Area (ASMA) and the Roanoke River Management Area (RRMA) was 154,617 pounds ( 39,942 fish). Commercial harvest in the ASMA was 116,057 pounds ( 27,735 fish). Recreational harvest in the ASMA was 11,763 pounds ( 3,466 fish ), and recreational harvest in the RRMA was 26,797 pounds ( 8,741 fish).

## V. Status of Research and Monitoring

Amendment 6 and its Addenda I-IV set the regulatory and monitoring measures for the coastwide striped bass fishery in 2018. Amendment 6 requires certain states to implement fishery-dependent monitoring programs for striped bass. All states with commercial fisheries or substantial recreational fisheries are required to define the catch and effort composition of these fisheries. Additionally, all states with a commercial fishery must implement a commercial harvest tagging program pursuant to Addendum III to Amendment 6.

Amendment 6 also requires certain states to monitor the striped bass population independent of the fisheries. Juvenile abundance indices are required from Maine (Kennebec River), New York (Hudson River), New Jersey (Delaware River), Maryland (Chesapeake Bay tributaries), Virginia (Chesapeake Bay tributaries), and North Carolina (Albemarle Sound). Spawning stock sampling is mandatory for New York (Hudson River), Pennsylvania (Delaware River), Delaware (Delaware River), Maryland (Upper Chesapeake Bay and Potomac River), Virginia (Rappahannock River and James River), and North Carolina (Albemarle Sound-Roanoke River). Amendment 6 requires NOAA Fisheries, USFWS, Massachusetts, New York, New Jersey, Maryland, Virginia, and North Carolina to continue their tagging programs, which provide data used to determine survivorship and migration patterns.

## VI. Status of Management Measures and Issues

## Coastal Commercial Quota

In 2018, the coastal commercial quota was $2,823,096$ pounds and was not exceeded, however Delaware exceeded its allocation by 9,943 pounds which will be deducted from its 2019 quota. Table 10 contains state-specific quotas and harvest that occurred in 2018, and final 2019 quotas.

## Chesapeake Bay Commercial Quota

In 2018, the Chesapeake Bay-wide quota was $3,120,247$ pounds and was allocated to Maryland, the PRFC, and Virginia based on historical harvest. In 2018, the Bay-wide quota was not exceeded and all
jurisdictions maintained harvest below its respective quota. Table 10 contains jurisdiction-specific quotas and harvest that occurred in 2018 for the Chesapeake Bay, and final 2019 quotas. In 2018, Commercial harvest from Chesapeake Bay accounted for $52 \%$ of total commercial landings by weight, and has averaged 57\% since implementation of Addendum IV in 2015.

## Chesapeake Bay Spring Harvest of Migrant Striped Bass

Recreational fishermen in the Chesapeake Bay are permitted to take adult migrant fish during a limited seasonal fishery, commonly referred to as the Spring Trophy Fishery. From 1993 to 2007 the fishery operated under a quota. Beginning in 2008, the Board approved non-quota management until stock assessment indicates that corrective action is necessary to reduce $F$ on the coastal stock. The Spring Trophy Fishery is currently managed via bag limits and minimum sizes (see Appendix 1 for state specific measures). The 2018 estimate of migrant fish harvested during the trophy season was 17,198 fish (17,104 fish in Maryland and 94 fish in Virginia) which is decrease compared to 2017 ( 22,892 fish) and below the 2006-2018 average of 40,990 fish (Horne 2019).

## Wave-1 Recreational Harvest Estimates

Evidence suggests that North Carolina, Virginia, and possibly other states have had sizeable wave-1 (January/February) recreational striped bass fisheries beginning in 1996 (NEFSC 2013b). MRIP, formerly the Marine Recreational Fisheries Statistics Survey (MRFSS), has sampled for striped bass in North Carolina during wave-1 since 2004 (other states are not currently covered during wave-1). For Virginia, harvest in wave- 1 is estimated via the ratio of landings and tag returns in wave-6 and regression analysis (refer to the methods described in ASMFC 2016 for more detail).

However, based on fishery-independent data collected by NCDMF, ASMFC and USFWS, striped bass distributions on their overwintering grounds during December through February has changed significantly since the mid-2000s. The migratory portion of the stocks has been well offshore in the EEZ ( $>3$ miles) effecting both Virginia's and North Carolina's striped bass winter ocean fisheries in recent years. Furthermore, North Carolina has reported zero striped bass harvest during wave-1 in the ocean for 2012-2018. Similarly, its commercial fishery has reported zero striped bass landings from the ocean during that time.

## Addendum II: Juvenile Abundance Index Analysis

The following states are required to conduct striped bass young-of-year juvenile abundance index (JAI) surveys on an annual basis: Maine for the Kennebec River; New York for the Hudson River; New Jersey for the Delaware River; Maryland for the Maryland Chesapeake Bay tributaries; Virginia for the Virginia Chesapeake Bay tributaries; and North Carolina for the A/R stock.

The PRT annually reviews trends in all required JAIs. The definition of recruitment failure is a value that is below $75 \%$ (the first quartile, or Q1) of all values in a fixed time series appropriate to each juvenile abundance index (see Addendum II for details). If any survey's JAI falls below their respective Q1 for three consecutive years, appropriate action should be recommended by the PRT to the Management Board.

For the 2019 review of JAls, the analysis evaluates the 2016, 2017, and 2018 JAI values. No state's JAI met the criteria for recruitment failure (Figure 8). North Carolina's JAI value was the only value below its respective Q1 in 2018. Maine's, New York's and New Jersey's JAl values were at or near the respective time series average in 2018, while Maryland's and Virginia's values were above average in 2018.

## Addendum III: Commercial Fish Tagging Program

Addendum III to Amendment 6 includes compliance requirements for monitoring commercial fishery harvest tagging programs. In 2018, all states implemented commercial tagging programs consistent with the requirements of Addendum III. Table 11 describes commercial tagging programs by state.

## Law Enforcement Reporting

States are asked to report and summarize law enforcement cases that occurred the previous season in annual compliance reports. In 2018, reported law enforcement cases (e.g., the number of warnings and citations) were similar to those reported in previous years. The most common violations were recreationally harvested fish under the legal size limit and possessing fish in excess of the bag limit.

## VII. Annual State Compliance and Plan Review Team Recommendations

In 2018, and based on annual state compliance reports (ASMFC 2019), the PRT determined that each state and jurisdiction implemented a management program consistent with the requirements of Amendment 6 and addenda I-IV (Table 12). Refer to Table 1 and Table 2 for a summary of 2018 striped bass fishing regulations by state. In 2018, Maryland implemented a 19" minimum size limit in the Chesapeake Bay recreational fishery through conservation equivalency. The regulations also require anglers to use non-offset circle hooks when live-lining or chumming, and prohibit the use of treble hooks.

Addendum III to Amendment 6 includes compliance requirements for monitoring commercial fishery harvest tagging programs. The PRT determined that all states with commercial striped bass fisheries implemented a commercial harvest tagging program in 2018 consistent with the requirements of Addendum III. Table 11 describes each state's commercial tag program requirements.

Amendment 6 includes compliance requirements for monitoring programs (summarized in Section V). Compliance with these requirements is summarized in Table 12. The PRT determined that each state and jurisdiction carried out the required monitoring programs in the 2018 fishing year. It should be noted that Virginia significantly modified its spawning stock monitoring and tagging program methodologies. Specifically, the pound net component of the spawning stock survey was eliminated and replaced with multi-panel anchor gill nets, while tagging was conducted through electrofishing. Both parts of the new monitoring programs were reviewed by the TC and approved by the Board at its February 2019 meeting. The PRT also notes that while the New York spawning stock monitoring program in the Hudson River does meet the requirements of the FMP, it does not provide an index of relative abundance to characterize the Hudson River stock which was identified as a high priority research recommendation at SAW 66.

Massachusetts reported two new regulatory changes for 2019: 1) a prohibition on the gaffing of nonconforming sized striped bass (i.e., less than $34^{\prime \prime}$ in the commercial fishery, and less than $28^{\prime \prime}$ in the recreational fishery); and 2 ) an allowance for non-conforming sized striped bass to be imported during the state's commercial striped bass season (fish previously had to meet the state's commercial minimum size limit during the open season, plus five days after its closure).

## VIII. Research Recommendations

The following categorized and prioritized research recommendations were developed by the 2018 Benchmark Stock Assessment Subcommittee and the $66^{\text {th }}$ SARC:

## Fishery-Dependent Priorities

High

- Continue collection of paired scale and otolith samples, particularly from larger striped bass, to facilitate development of otolith-based age-length keys and scale-otolith conversion matrices.
- Develop studies to provide information on gear specific (including recreational fishery) discard morality rates and to determine the magnitude of bycatch mortality ${ }^{5}$.
- Conduct study to directly estimate commercial discards in the Chesapeake Bay.
- Collect sex ratio information on the catch and improve methods for determining population sex ratio for use in estimates of female SSB and biological reference points.

## Moderate

- Improve estimates of striped bass harvest removals in coastal areas during wave 1 and in inland waters of all jurisdictions year round.

## Fishery-Independent Priorities

## High

- Develop and index of relative abundance from the Hudson River Spawning Stock Biomass survey to better characterize the Delaware Bay/Hudson River stock.
- Improve the design of existing spawning stock surveys for Chesapeake Bay and Delaware Bay.

Moderate

- Develop a refined and cost-efficient, fisheries-independent coastal population index for striped bass stocks.
- Collect sex ratio information from fishery-independent sources to better characterize the population sex ratio.

## Modeling/Quantitative Priorities

High

- Develop better estimates of tag reporting rates; for example, through a coastwide tagging study.
- Investigate changes in tag quality and potential impacts on reporting rate.
- Explore methods for combining tag results from programs releasing fish from different areas on different dates.

[^3]- Develop field or modeling studies to aid in estimation of natural mortality and other factors affecting the tag return rate.
- Compare M and F estimates from acoustic tagging programs to conventional tagging programs.

Moderate

- Examine methods to estimate temporal variation in natural mortality.

Low

- Evaluate truncated matrices to reduce bias in years with no tag returns and covariate based tagging models to account for potential differences from size or sex or other covariates.

## Life History and Biology

## High

- Continue in-depth analysis of migrations, stock compositions, sex ratio, etc. using mark-recapture data ${ }^{6}$.
- Continue evaluation of striped bass dietary needs and relation to health condition.
- Continue analysis to determine linkages between the Mycobacteriosis outbreak in Chesapeake Bay and sex ratio of Chesapeake spawning stock, Chesapeake juvenile production, and recruitment success into coastal fisheries.

## Moderate

- Examine causes of different tag based survival estimates among programs estimating similar segments of the population.
- Continue to conduct research to determine limiting factors affecting recruitment and possible density implications.
- Conduct study to calculate the emigration rates from producer areas now that population levels are high and conduct multi-year study to determine inter-annual variation in emigration rates.

## Striped Bass Research Priorities Identified as Being Met or Well in Progress

- Evaluate to what extent rising natural mortality among Chesapeake Bay striped bass affects the existing $F$ and female SSB thresholds, which are based on a fixed $M$ assumption ( $M=0.15$ ).
- Develop simulation models to look at the implications of overfishing definitions relative to development of a striped bass population that will provide "quality" fishing. Quality fishing must first be defined.
- Evaluate the stock status definitions relative to uncertainty in biological reference points.
- Develop a method to integrate catch-at-age and tagging models to produce a single estimate of $F$ and stock status ${ }^{7}$.
- Develop a spatially and temporally explicit catch-at-age model incorporating tag based movement information ${ }^{8}$.
- Develop maturity ogives applicable to coastal migratory stocks.

## X. Tables and Figures

Table 1. Summary of Atlantic Striped bass commercial regulations in 2018. Source: 2019 State Compliance Reports. Minimum sizes and slot size limits are in total length (TL). *commercial quota reallocated to recreational bonus fish program

| STATE | SIZE LIMITS | SEASONAL QUOTA | OPEN SEASON |
| :---: | :---: | :---: | :---: |
| ME | Commercial fishing prohibited |  |  |
| NH | Commercial fishing prohibited |  |  |
| MA | $34^{\prime \prime}$ minimum size | 869,813 lbs. Hook \& line only | 6.23 until quota reached, Monday and Thursdays only. Fishing prohibited on July 3, July 4, and Labor Day. |
|  | Floating fish trap: 26" minimum size | Total: 181,572 lbs., split 39:61 between the trap and general category. Gill netting prohibited. | Trap: 4.1-12.31, or until quota reached; unlimited possession limit until $70 \%$ of quota projected to be harvested, then 500 |
| RI | General category (mostly rod \& reel): 34 " min. |  | General Category: 5.20-8.04, 8.05-12.31, or until quota reached. Closed Fridays and Saturdays. 5 fish/vessel/day possession limit. |
| CT* | Commercial fishing prohibited; bonus program: 1 fish at $22^{\prime \prime}-<28^{\prime \prime}$ slot size, $5.1-12.31$ (voucher required) |  |  |
| NY | 28"-38" minimum size (Hudson River closed to commercial harvest) | $795,795 \mathrm{lb}$. Pound nets, gill nets ( $6^{\prime \prime}$ 8"stretched mesh), hook \& line. | $6.1-12.15$, or until quota reached. Limited entry permit only. |
| NJ* | Commercial fishing prohibited; bonus program: 1 fish at $24^{\prime \prime}-<28^{\prime \prime}$ slot size limit, $9.1-12.31$ (permit required) |  |  |
| PA | Commercial fishing prohibited |  |  |
| DE | Gillnet: $28^{\prime \prime}$ minimum size, except $20^{\prime \prime} \mathrm{min}$ in Del. Bay and River during spring season. Hook and Line: 28 " min | Gillnet: 137,831 lbs. <br> Hook and line: 14,509 lbs. | Gillnet: 2.15-5.31 (2.15-3.30 for Nanticoke River) \& 11.15-12.31; drift nets only 2.15-28 \& 5.1-31; no fixed nets in DE River. No trip limit. |

(Table 1 continued - Summary of commercial regulations in 2018)

| STATE | SIZE LIMITS | SEASONAL QUOTA | OPEN SEASON |
| :---: | :---: | :---: | :---: |
| MD | Ocean: 24" minimum CB and Rivers: 18 " -36 " | Ocean: 90,727 lbs. <br> CB and Rivers: 1,471,888 lbs. (part of Baywide quota). | Ocean: 1.1-5.31, 10.1-12.31, Mon- Fri <br> Bay Pound Net: 6.1-11.30, Mon-Sat <br> Bay Haul Seine: 6.1-11.30, Mon-Fri <br> Bay Hook \& Line: 6.4-12.29, Mon-Thu <br> Bay Drift Gill Net: 1.1-2.28, 12.3-12.31, Mon-Fri |
| PRFC | 18"-36" slot limit 2.15- <br> 3.25 and $18^{\prime \prime}$ minimum <br> size all other seasons | $583,362 \mathrm{lbs}$. (part of Bay-wide quota). Allocated by gear and season. | Hook \& line: 1.1-3.25, 6.1-12.31 <br> Pound Net \& Other: 2.15-3.25, 6.1-12.15 <br> Gill Net: 1.1-3.25, 11.13-12.31 <br> Misc. Gear: 2.15-3.25, 6.1-12.15 |
| DC | Commercial fishing prohibited |  |  |
| VA | Ocean: $28^{\prime \prime}$ min CB and Rivers: $18^{\prime \prime}$ minimum and $18^{\prime \prime}-28^{\prime \prime}$ slot | Ocean: $136,141 \mathrm{lbs} . \mathrm{CB}$ and Rivers: $1,064,997 \mathrm{lbs}$. (part of Bay- wide quota). ITQ- system for both areas. | Ocean: 1.16-12.31 <br> CB and Rivers: 1.16-12.31 |
| NC | Ocean: 28" | 360,360 lbs. (split between gear types). Number of fish allocated to each permit holder. Allocation varies by permit. | Seine fishery was open for 120 days, 150 fish/permit Gill net fisher was open for 45 days, 50 fish/permit Trawl fishery was not opened due to lack of striped bass presence. |

Table 2. Summary of Atlantic Striped bass recreational regulations in 2018. Source: 2019 State Compliance Reports. Minimum sizes and slot size limits are in total length (TL).

| STATE | SIZE LIMITS | BAG LIMIT | GEAR/FISHING RESTRICTIONS | OPEN SEASON |
| :---: | :---: | :---: | :---: | :---: |
| ME | $\geq 28^{\prime \prime}$ minimum size | 1 fish/day | Hook \& line only; circle hooks only when using live bait | All year, except spawning areas are closed Dec 1-April 30 and catch and release only May 1 - June 30 |
| NH | $\geq 28^{\prime \prime}$ minimum size | 1 fish/day | Gaffing and culling prohibited | All year |
| MA | $\geq 28^{\prime \prime}$ minimum size | 1 fish/day | Hook \& line only; no high-grading | All year |
| RI | $\geq 28^{\prime \prime}$ minimum size | 1 fish/day | None | All year |
| CT | $\geq 28^{\prime \prime}$ minimum size | 1 fish/day | Spearing and gaffing prohibited | All year |
| NY | Ocean and Delaware River: <br> $\geq 28^{\prime \prime}$ minimum size | 1 fish/day | Angling only. Spearing permitted in ocean waters. Catch and release only during closed season. | Ocean: April 15 - Dec 15 Delaware River: All year |
|  | Hudson River: 18-28" slot limit, or $\geq 40$ " |  |  | Hudson River: April 1 - Nov 30 |
| NJ | 1 fish at 28 to < 43 " , and 1 fis | h $\geq 43^{\prime \prime}$ | Circle hooks required while fishing with natural bait during spring spawning ground closure | Ocean: All year <br> All other waters: March 1 - Dec 31, except spawning ground closure April 1 - May 31 in the lower Delaware River and tributaries |
| PA | Upstream from Calhoun St Bridge: 1 fish at $\geq 28^{\prime \prime}$ minimum size |  |  |  |
|  | Downstream from Calhoun St Bridge: 1 fish at $\geq 28^{\prime \prime}$ minimum size, from $4.1-5.31$, a 2 fish at 21-25" slot size limit |  |  |  |
| DE | $28^{\prime \prime}$ minimum size, no harvest 38-43" (inclusive). | 2 fish/day | Hook \& line, spear (for divers) only. Circle hooks required in spawning season. | All year. Catch and release only April 1 - May 31 in spawning grounds. In Del. River, Bay \& tributaries, may only harvest 20-25"slot from July 1 - Aug 31 |

(Table 2 continued - Summary of recreational regulations in 2018).

| STATE | SIZE LIMITS | BAG LIMIT | GEAR/FISHING RESTRICTIONS | OPEN SEASON |
| :---: | :---: | :---: | :---: | :---: |
| MD^ | Ocean: 28"-38" slot, or >44" | 2 fish/day |  | All year |
|  | CB: Catch and Release Only | C\&R only | no eels | Jan 1-Feb 28, March 1 - April 20 (mainstem only, tributaries closed) |
|  | CB Spring Trophy: 35" minimum | 1 fish/day | mainstem only from Baltimore to VA line | April 21 - May 15 |
|  | CB Summer and Fall: 19" minimum, only 1 fish can be $>28^{\prime \prime}$ | 2 fish/day | non-offset circle hooks when live-lining or chumming, no treble hooks when bait fishing | May 16-31, mainstem Bay only, Baltimore to VA line; June 1 - Dec 15 all Bay and Tributaries open |
| PRFC | Spring Trophy: 35" minimum | 1 fish/day | Downstream of Rt. 301 Bridge - No more than two hooks or sets of hooks per rod or line. No high-grading allowed and no live eel. | April 20 - May 15 |
|  | Summer and Fall: 20" minimum and only 1 fish can be $>28^{\prime \prime}$ | 2 fish/day | No more than two hooks or sets of hooks for each rod or line | May 16 - Dec 31 |
| DC | $20^{\prime \prime}$ minimum size and only one fish can be >28" | 2 fish/day | hook and line only | May 16 - Dec 31 |
| VA | Ocean: 28 " minimum size | 1 fish/day | Hook \& line, rod \& reel, hand line only. Gaffing is illegal in Virginia marine waters. | Jan 1 - March 31 and May 16 - Dec 31 |
|  | Ocean Spring Trophy: 36" min | 1 fish/day |  | May 1 - May 15 |
|  | CB Trophy: 36" minimum | 1 fish/day | No possession of striped bass in the Spawning Reaches | May 1 - June 15 |
|  | Chesapeake Bay Spring: 20 " $28^{\prime \prime}$ | 2 fish/day | One fish can be greater 36" during the trophy season only | May 16 - June 15 |
|  | CB Fall: 201 minimum | 2 fish/day | size and only one fish can be > 28 " | Oct 4 - Dec 31 |
| NC | Ocean: $\geq 28$ " minimum size | 1 fish/day | No gaffing allowed | All year |

${ }^{\wedge}$ Susquehanna Flats: C\&R only Jan 1 - May 3; 1 fish at $19^{\prime \prime}-26^{\prime \prime}$ slot May 16 - May 31. Northeast River: C\&R only May 16 - May 31

Table 3. Total removals (harvest plus discards/release mortality) of Atlantic striped bass by sector in numbers of fish, 1990-2018. Note: Harvest is from ACCSP/MRIP, discards/release mortality is from ASMFC. Estimates exclude inshore harvest from North Carolina.

| Year | Commercial |  | Recreational |  | Total <br> Removals |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Harvest | Discards | Harvest | Release Mortality | $1,162,226$ |
| 1990 | 93,888 | 46,630 | 578,897 | 442,811 | $1,75,478$ |
| 1991 | 158,491 | 90,439 | 798,260 | $7,762,667$ |  |

* Commercial harvest/sale prohibited, with no re-allocation of quota.
** Commercial harvest/sale prohibited, with re-allocation of quota to the recreational fishery.
† Ocean commercial quota reduced through conservation equivalency for MD ( $90,727 \mathrm{lbs}$ ) and RI (181,572 lbs)

Table 11. Status of Commercial Tagging Programs by state for 2018.

| State | Number of Participants | Number of Tags Issued | Number of Tags Used | Point of Tag (sale/harvest) | ${ }^{1}$ Biological Metric (Y/N) | Year, State and <br> Unique ID on Tag (Y/N) | Size Limit on Tag (Y/N) | Tag Colors | Annual Tag Color Change (Y/N) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| MA | 92 | 53,100 | 37,777 | Sale | Y | $Y$ | Y | one tag color | Y |
| RI | 23 | 15,390 | 10,121 | Sale | Y | Y | N | two tag colors by gear | Y |
| NY | 436 | 76,605 | 52,218 | Harvest | Y | Y | N | One tag color | Y |
| DE* | 260 | 19,155 | 11,356 | Both | Y | Y | N | Harvest: two tag colors by gear Sale: one color | Y |
| MD | 862 | 454,356 | 295,348 | Harvest | Y | Y | N | Three tag colors by gear and permit | Y |
| PRFC | 339 | 79,158 | 64,346 | Harvest | Y | Y | N | Five tag colors by gear | N |
| VA | 388 | 155,254 | 151,250 | Harvest | Y | Y | Y | two tag colors by area | Y |
| NC^ | 88 | 36,766 | 31,147 | Sale | Y | Y | Y | Three tag colors by area | N |

${ }^{1}$ States are required to allocate commercial tags to permit holders based on a biological metric. Most states used the average weight per fish from the previous year, or some variation thereof. Actual biological metric used is to be included in State Annual Commercial Tag Reports.

* The number of tags issued represent the combined total from tags used by harvesters and weigh stations, such that each fish has two tags
$\wedge$ All commercial tags were used in the internal waters of North Carolina

Table 12. Status of compliance with monitoring and reporting requirements in 2018. JAI = juvenile abundance index survey, $\mathrm{SSB}=$ spawning stock biomass survey, tag = participation in coastwide tagging program, $\mathrm{Y}=$ compliance standards met, $\mathrm{N}=$ compliance standards not met, NA = not applicable, R = recreational, C = commercial

| Jurisdiction | Fishery-independent <br> monitoring | Fishery-dependent monitoring |  | Annual <br> reporting |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Requirement(s) | Status | Requirement(s) | Status | Status |
|  | JAI | Y | composition, catch and effort (R) | NA | Y |

Figure 3. Albemarle Sound-Roanoke River striped bass female spawning stock biomass and recruitment (abundance of age-1), and biological reference points, 1982-2014. Source: Stock Status of Albemarle Sound-Roanoke River Striped bass, 2016

Figure 4. Albemarle Sounds-Roanoke River striped bass fishing mortality (F) estimates, and biological reference points, 1982-2014. Source: Stock Status of Albemarle Sound-Roanoke River Striped bass, 2016.

Figure 5. Total striped bass removals by sector in numbers of fish, 1982-2018. Note: Harvest is from ACCSP/MRIP, discards/release mortality is from ASMFC. Estimates exclude inshore harvest from A/R.

Figure 6. Commercial Atlantic striped bass landings by state in pounds, 1990-2018. Source: ACCSP. Commercial harvest and sale prohibited in ME, NH, CT, and NJ. NC is ocean only.

Figure 7. Total recreational catch and the proportion of fish released alive, 1982-2018. Source: MRIP/ASMFC. Estimates exclude inshore harvest from A/R.

Figure 8. Juvenile abundance index analysis for Maine, New York, Jew Jersey, Maryland, Virginia, and North Carolina. Source: Annual State Compliance Reports. Q1 = first quartile. An open bar in the last three years indicates a value below the Q1 threshold.

[^0]:    ${ }^{1}$ The 1997 reauthorization of the Striped Bass Act also required the Secretaries of Commerce and Interior provide a biennial report to Congress highlighting the progress and findings of studies of migratory and estuarine Striped Bass. The ninth such report was recently provided to Congress (Shepherd et al. 2017).

[^1]:    ${ }^{2}$ While NOAA Fisheries continues to implement a complete ban on the fishing and harvest of striped bass in the EEZ, Amendment 6 includes a recommendation to consider reopening the EEZ to striped bass fisheries. In September 2006, NOAA Fisheries concluded that it would be imprudent to open the EEZ to striped bass fishing because it could not be certain that opening the EEZ would not lead to increased effort and an overfishing scenario.
    ${ }^{3}$ The decision to hold Delaware's commercial quota at the 2002 level is based on tagging information that indicated F on the Delaware River/Bay stock is too high, and uncertainty regarding the status of the spawning stock for the Delaware River/Bay.

[^2]:    ${ }^{4}$ By weight, New Jersey had the largest proportion of harvest (30\%), followed by Massachusetts (21\%), Maryland (20\%), New York (15\%), and Connecticut and Rhode Island both at 5\% (Table 8).

[^3]:    ${ }^{5}$ Literature search and some modeling work completed

[^4]:    ${ }^{6}$ Ongoing through Cooperative Winter Tagging Cruise and striped bass charter boat tagging trips. See Cooperative Winter Tagging Cruise 20 Year Report.
    ${ }^{7}$ Model developed, but the tagging data overwhelms the model. Issues remain with proper weighting
    ${ }^{8}$ Model developed with Chesapeake Bay and the rest of the coast as two stocks. External analysis of tagging data is used to inform the model but is not explicitly incorporated.
