## ATLANTIC STATES MARINE FISHERIES COMMISSION

## REVIEW OF THE INTERSTATE FISHERY MANAGEMENT PLAN <br> FOR ATLANTIC STRIPED BASS <br> (Morone saxatilis)

## 2013 and 2014 FISHING YEARS

Prepared by the Plan Review Team

Approved by the Atlantic Striped Bass Management Board

## Executive Summary

Atlantic Striped Bass from Maine through North Carolina are managed under Amendment 6 and Addenda I-IV to the Interstate Fishery Management Plan.

A benchmark stock assessment was peer reviewed by the $57^{\text {th }}$ Stock Assessment Review Committee in July 2013. The 2013 benchmark assessment was approved by the Management Board for management use in October 2013. Addendum IV to Amendment 6 was approved by the Board in October 2014, and implemented prior to the start of the 2015 fishing season. The addendum contained new fishing mortality reference points, and required coastal and Chesapeake Bay states/jurisdictions to reduce removals by 25 and $20.5 \%$, respectively, in order to reduce F to a level at or below the new target.

Total Striped Bass harvest in 2014 is estimated at 2.53 million fish or 30.0 million pounds, which is a $7 \%$ decrease by weight and a $12 \%$ decrease by number from 2013. The recreational fishery harvested 1.78 million fish ( 24.06 million pounds) in 2014, while the commercial fishery harvested 766,298 fish ( 5.94 million pounds). Dead discards from the recreational fishery are estimated at 655,429 fish.

In 2013 and 2014, all states implemented management programs consistent with Amendment 6 and Addenda I-IV. All but one state harvested below their costal commercial quota in 2013. Massachusetts exceeded their quota by 6,591 pounds resulting in an effective quota of $1,153,159$ for 2014. All commercial state fisheries harvested below their coastal commercial quotas in 2014. The Chesapeake Bay quota in 2014 was 8.65 million pounds and was not exceeded. In 2015, all commercial fisheries will be allotted quotas as listed in Addendum IV to Amendment 6.

All states have implemented monitoring programs consistent with Amendment 6. Requirements vary by state, and may include monitoring commercial and/or recreational catch, effort, and catch composition, monitoring commercial tagging programs, and performing juvenile abundance surveys, spawning stock surveys, and tagging programs.

For the 2015 review of JAIs the analysis evaluates the 2012, 2013, and 2014 JAI values. No state's JAI met the criteria for recruitment failure, but every state's JAI analysis except Maine has had at least one value within the last three years fall below the Q1 threshold

| Management Unit: | Migratory stocks of Atlantic Striped Bass from Maine through North Carolina |
| States With Declared Interest: | Maine - North Carolina, including Pennsylvania |
| Additional Jurisdictions: | District of Columbia, Potomac River Fisheries Commission, National Marine Fisheries Service, United States Fish and Wildlife Service |
| Active Boards/Committees: | Atlantic Striped Bass Management Board, Advisory Panel, Technical Committee, Stock Assessment Subcommittee, Tagging Subcommittee, Plan Review Team, and Plan Development Team |

The Atlantic States Marine Fisheries Commission (Commission) developed a fisheries management plan (FMP) for Atlantic Striped Bass in 1981 in response to declining juvenile recruitment and landings. The FMP recommended increased restrictions on commercial and recreational fisheries, such as minimum size limits and harvest closures on spawning grounds. Two amendments were passed in 1984 recommending additional management measures to reduce fishing mortality. To strengthen the management response and improve compliance and enforcement, the Atlantic Striped Bass Conservation Act (P.L. 98-613) was passed in late 1984, which mandated the implementation of Striped Bass regulations passed by the Commission, and gave the Commission authority to recommend to the Secretaries of Commerce and Interior that states be found out of compliance when they failed to implemented management measures consistent with the FMP.

The first enforceable plan, Amendment 3, was approved in 1985, and required size regulations to protect the 1982 year class, which was the first modest size cohort since the previous decade. The objective was to increase size limits to allow at least $95 \%$ of the females in the cohort to spawn at least once. Smaller size limits were permitted in producer areas than along the coast. Several states, beginning with Maryland in 1985, opted for a more conservative approach and imposed a total moratorium on Striped Bass landings for several years. The amendment contained a trigger mechanism to reopen the fisheries when the 3 -year moving average of the Maryland juvenile abundance index (JAI) exceeded an arithmetic mean of 8.0. That level was attained with the recruitment of the 1989 year class.

Consequently, Amendment 4 was adopted to allow state fisheries to reopen in 1990 under a target fishing mortality ( F ) of 0.25 , which was half the estimated F needed to achieve maximum sustainable yield (MSY). The amendment allowed an increase in the target F once spawning stock biomass (SSB) was restored to levels estimated during the late 1960s and early 1970s. The dual size limit concept was maintained, and a recreational trip limit and commercial season implemented to reduce the harvest to $20 \%$ of that in the historic period of 1972-1979. The amendment and its four addenda aimed to rebuild the resource, rather than maximize yield.

In 1995, coastal Striped Bass were declared restored by the Commission, and Amendment 5 was adopted to increase the target F to 0.33 , midway between the existing F target $(0.25)$ and $\mathrm{F}_{\mathrm{MSY}}$, which was revised to 0.40 . Regulations were developed to allow $70 \%$ of the historic harvest and achieve the target F , although states were allowed to submit proposals for alternative regulations that were conservationally equivalent. From 1997-2000, a series of five addenda were implemented to respond to the latest stock status information. The Albemarle/Roanoke stock of Striped Bass, currently assessed independently by the State of North Carolina and managed under a separate North Carolina’s Fishery Management Plan, was declared restored in 1997.

In 2003, Amendment 6 was adopted to address five limitations within the management program: 1) potential inability to prevent the Amendment 5 exploitation target from being exceeded; 2) perceived decrease in availability or abundance of large Striped Bass in the coastal migratory population; 3) a lack of management direction with respect to target and threshold biomass levels; 4) inequitable effects of regulations on the recreational and commercial fisheries, and coastal and producer area sectors; 5) and excessively frequent changes to the management program. Amendment 6 was fully implemented by January 1, 2004, and completely replaced all previous Commission plans for Atlantic Striped Bass.

The goal of Amendment 6 is to perpetuate, through cooperative interstate management, migratory stocks of Striped Bass; to allow commercial and recreational fisheries consistent with the longterm maintenance of a broad age structure, a self-sustaining spawning stock; and also to provide for the restoration and maintenance of their essential habitat. In support of this goal, the following objectives are included:

- Manage Striped Bass fisheries under a control rule designed to maintain stock size at or above the target female spawning stock biomass level and a level of fishing mortality at or below the target exploitation rate.
- Manage fishing mortality to maintain an age structure that provides adequate spawning potential to sustain long-term abundance of Striped Bass populations.
- Provide a management plan that strives, to the extent practical, to maintain coastwide consistency of implemented measures, while allowing the States defined flexibility to implement alternative strategies that accomplish the objectives of the FMP.
- Foster quality and economically viable recreational, for-hire, and commercial fisheries.
- Maximize cost effectiveness of current information gathering and prioritize state obligations in order to minimize costs of monitoring and management.
- Adopt a long-term management regime that minimizes or eliminates the need to make annual changes or modifications to management measures.
- Establish a fishing mortality target that will result in a net increase in the abundance (pounds) of age 15 and older Striped Bass in the population, relative to the 2000 estimate.

Amendment 6 modified the F targets and thresholds, and introduced a new set of biological reference points (BRPs) based on females spawning stock biomass (SSB), as well as a list of management triggers based on the BRPs. (The targets and thresholds were updated in 2008; see Sections II and IV for more information.) The coastal commercial quotas for Striped Bass were restored to $100 \%$ of the states' average landings during the 1972-1979 historical period, except for Delaware's coastal commercial quota, which remained at the level allocated in 2002. In the recreational fisheries, all states were required to implement a two fish bag limit with a minimum size limit of 28 inches, except for the Chesapeake Bay fisheries, fisheries that operate in the Albemarle Sound and Roanoke River, and states with approved alternative regulations. The Chesapeake Bay and Albemarle/Roanoke regulatory programs were predicated on a more conservative F target than the coastal migratory stock, which allowed these jurisdictions to implement separate seasons, harvest caps, and size and bag limits as long as they remain under that F target. No minimum size limit can be less than 18 inches under Amendment 6 . The same minimum size standards regulate the commercial fisheries as the recreational fisheries, except for a minimum 20 inch size limit in the Delaware Bay spring gillnet fishery.

States are permitted the flexibility to deviate from these standards by submitting proposals for review by the Striped Bass Technical Committee, Advisory Panel, and Plan Review Team and contingent upon the approval of the Management Board. A state may request a change only if it can demonstrate that the action is "conservationally equivalent" to the management standards or will not contribute to the overfishing of the resource. This practice has resulted in a variety of regulations among states (see Tables 1 and 2).

In 2007, Addendum I was implemented to establish a bycatch monitoring and research program to increase the accuracy of data on Striped Bass discards and also recommend development of a webbased angler education program.

In May 2009, the Management Board initiated the development of an addendum to consider options to roll over unused coastal commercial quota up to fifty percent, and approved sending the draft addendum out for public comment in August 2009. In November 2009, the Board voted for status quo management in regards to unused quota rollover.

In February 2010, the Management Board initiated the development of an addendum to consider options to increase the coastal commercial quota. The Board approved the draft addendum for public comment in May 2010, with the addition of an option to consider adopting a Technical Committee recommendation to revise the JAI management trigger. Adopting the Technical Committee recommendation would modify the definition of recruitment failure, such that each index would have a fixed numerical value indicating failure, rather than one that changes from year to year. The Board approved Addendum II, and the revised JAI management triggers, in November 2010. The new definition of recruitment failure is a value that is below $75 \%$ of all values in a fixed time series appropriate to each juvenile abundance index.

In 2012, Addendum III was approved by the Board. This addendum requires all states and jurisdictions with a commercial fishery to implement a commercial harvest tagging program. The addendum was initiated in response to significant poaching events in the Chesapeake Bay and aims to limit illegal harvest of Striped Bass.

The Board approved Addendum IV in 2014 in response to the 2013 benchmark assessment which indicates a steady decline in spawning stock biomass since the mid-2000s. The Addendum establishes new fishing mortality reference points ( F target and threshold), and required coastal states to reduce removals in order to reduce F to a level at or below the new target (i.e., $25 \%$ reduction from 2013 removals for the coastal fishery and 20.5\% reduction from 2012 removals for Chesapeake Bay fishery). Additionally, since the Albemarle/Roanoke stock is thought to contribute minimally to the coastwide complex, Addendum IV differs management of the Albemarle/Roanoke stock to the State of North Carolina using stock-specific BRPs approved by the Management Board.

The Exclusive Economic Zone (EEZ) has been closed to the harvest and possession of Striped Bass since 1990, with the exception of a defined route to and from Block Island in Rhode Island. A recommendation was made in Amendment 6, and submitted to the Secretary of Commerce, to re-open federal waters to commercial and recreational fisheries. Starting in July 2003 and continuing for several years, National Marine Fisheries Service (NMFS) took steps in the rulemaking process to consider the proposal. In September 2006, NMFS concluded that it would be imprudent to open the EEZ to Striped Bass fishing and chose not to proceed further in its rulemaking. Specifically, NMFS concluded that: 1) it could not be certain, especially after taking into account the overwhelming public perception that large trophy sized fish congregate in the EEZ, that opening the EEZ would not increase effort and lead to an increase in mortality that would exceed the threshold, and 2) both the Commission's and NMFS' ability to immediately respond to an overfishing and/or overfished situation is a potential issue, particularly given the timeframe within which Amendment 6 was created, and given the lag time in which a given year's data is available to management (71 FR 54261-54262). Additionally, in October 2007, President George W. Bush issued an Executive Order (E.O. 13449) prohibiting the sale of Striped Bass (and red drum) caught within the EEZ. The Order also requires the Secretary of Commerce to encourage management for conservation of the resources, including State designation as gamefish where the State determines appropriate under applicable law, and to periodically review the status of the populations within US jurisdictional waters. The 2011 report (submitted in 2012) is the most recent report to Congress on the status of the Striped Bass population (NOAA 2012). The 2015 Striped Bass Report to Congress is scheduled for completion at the end of August.

## II. Status of the Stocks

## Atlantic Striped Bass Stocks

The 2013 benchmark stock assessment was completed by the $57^{\text {th }}$ Stock Assessment Workshop (SAW) and peer reviewed by the Stock Assessment Review Committee (SARC) in July 2013. Based on recommendations by the $47^{\text {th }}$ SAW/SARC in 2007, the statistical catch-at-age (SCA) model in the benchmark assessment was generalized to allow specification of multiple fleets, different stock-recruitment relationships, and year- and age-specific natural mortality rates, among
other things. For this assessment, new fishing mortality (F) reference points were chosen to link the target and threshold F with the target and threshold female spawning stock biomass (SSB). The 2013 assessment, and the new F reference points, were approved by the Board for management use at its October 2013 meeting. The 2013 SCA model was used to estimate fishing mortality, abundance, and spawning stock biomass of Striped Bass during 1982-2012. Based on results of the 2013 benchmark assessment, and comparison to the biological reference points below, Atlantic Striped Bass are not overfished and are not experiencing overfishing.

|  | Female Spawning Stock Biomass | Fully-Recruited Fishing Mortality |
| :--- | :---: | :---: |
| Threshold | $\mathrm{SSB}_{1995}=57,626$ metric tons | $\mathrm{F}_{\mathrm{msy}}=0.22$ |
| Target | $\mathrm{SSB}_{\text {threshold }} \times 1.25=72,032$ metric tons | 0.18 |
|  | (Chesapeake Bay and coastal stocks) |  |

The SCA model estimated female spawning stock biomass (SSB) at 58,238 metric tons (MT) in 2012 which is above the SSB threshold $(57,626 \mathrm{mt})$ but well below the target $(72,032)$ (Figure 1$)$. The 2012 estimate of SSB was a decrease from the 2011 estimate of 61,972 MT and SSB estimates have continued to decrease from the time series maximum of 78,544 MT in 2003. Recruitment estimated in the SCA model as age-1 abundance was 140.4 million fish in 2012, which is a $31 \%$ increase from the 2011 estimate ( 106.9 million fish). The 2012 estimate is the first estimate above the 1994-2004 average ( 120.8 million fish) since 2004 (Figure 2). The average estimated recruitment during 2005-2012, the time period representing the last year that SSB was estimated above the target, was 85.6 million fish. The 2004 recruitment estimate ( 2003 year class) remains the second largest recruitment estimate since 1982 at 157.5 million fish. The SCA model estimated the 2012 fishing mortality rate $(\mathrm{F})$ on age $8-11$ fish to be $\mathrm{F}=0.19$, which is below the fishing mortality threshold but above the target (Figure 3).

Overall, the conclusion is that spawning stock abundance has declined since the 2003 time series high. The decrease in abundance is reflected in a declining trend of coastwide catch from 2007 to present (Figure 4), particularly in recreational discards comprised of smaller fish. Despite the decline in abundance, the spawning stock in 2012 remained relatively high due to the growth and maturation of the 2003 year class and the accumulation of spawning stock biomass from prior year classes.

## Albemarle Sound/Roanoke River Striped Bass Stocks

The most recent Albemarle Sound/Roanoke River (A/R) stock assessment (data through 2012) utilized the ASAP3 statistical catch at age model. The NC-specific assessment was peer reviewed and approved for management use, as recommended by the Technical Committee, by the Atlantic Striped Bass Management Board at their August 2014 meeting. The model incorporated all commercial and recreational harvest and discard data from the Albemarle Sound and Roanoke River Management Areas (ASMA and RRMA), as well as abundance data for the A/R stock from fishery independent surveys conducted by North Carolina Division of Marine Fisheries (NCDMF) and North Carolina Wildlife Resources Commission (NCWRC) staff.

Results from the assessment indicated the stock is not overfished or experiencing overfishing relative to $\mathrm{A} / \mathrm{R}$ specific biological reference points below.

| (A/R) Reference Point | Fishing <br> Mortality (F) | Spawning Stock <br> Biomass (pounds) | Total Allowable <br> Landings pounds <br> (pounds) |
| :--- | :---: | :---: | :---: |
| Target | 0.33 | 969,496 | 305,762 |
| Threshold | 0.41 | 785,150 | 325,905 |

Although the stock is not overfished, female spawning stock biomass has declined steadily since its peak in 2003, and is estimated at 835,462 pounds, just above the threshold of 772,588 pounds. $\mathrm{A} / \mathrm{R}$ Striped Bass experienced a period of unusually strong recruitment (number of age- 1 fish entering the population) from 1994-2001 followed by a period of lower recruitment from 20022013 (Figure 5). Total stock abundance reached its peak in the late 1990s and has declined gradually since, averaging about 1.5 million fish in recent years. Additionally, fishing mortality is estimated at 0.34 , just above the target of 0.33 (Figure 6).

Overall, the trends in the A/R stock are quite similar to the Atlantic Striped Bass stocks described above, with a steady decline in female SSB since 2003. An update of the A/R stock assessment with data through 2014 will begin in August 2015.

## III. Status of the Fishery

Total Striped Bass commercial and recreational harvest in 2014 (excluding harvest from within the Albemarle Sound and Roanoke River) is estimated at nearly 30.0 million pounds or 2.53 million fish (Figures 7 and 8; Tables 3-6). This is a $7 \%$ decrease by weight and a $12 \%$ decrease by number from 2013. The commercial and recreational fisheries harvested 20 and $80 \%$, respectively by weight, and 30 and $70 \%$ by number in 2014.

The commercial fishery (coastal and Chesapeake Bay combined) landed 5.94 million pounds in 2014, slightly higher than landings in 2013 ( 5.82 million pounds). The Chesapeake Bay jurisdictions accounted for $65 \%$ the 2014 commercial landings by weight (pounds); Maryland landed $32 \%$, Virginia landed $23 \%$, and PRFC landed $10 \%$. Additional landings came from Massachusetts (19\%), New York (9\%), Rhode Island (4\%), Delaware (3\%), and New Jersey ( $<1 \%$ ). Total commercial dead discards were estimated at 931,391 fish, indicating increased catch of sub-legal sized fish.

The total coastal commercial harvest in 2014 was 2.36 million pounds, which was a $7 \%$ decrease from the 2013 coastal landings of 2.53 million pounds. The total Chesapeake Bay commercial harvest in 2014 was 3.58 million pounds, which is a $9 \%$ increase from the 2013 harvest of 3.29 million pounds.

In 2014, the recreational fishery (coastal and Chesapeake Bay combined) landed an estimated 1.78 million fish ( 24.1 million pounds). This was a $16 \%$ decrease from 2013 landings by number ( 2.12 million fish) and a $9 \%$ decrease by weight ( 26.4 million pounds). The coastal recreational harvest was 20.33 million pounds. The recreational Chesapeake Bay-wide harvest was 3.73 million pounds and represents nearly a $48 \%$ increase in Chesapeake harvest from 2013 ( 2.52 million pounds).

Recreational releases were estimated at 7.28 million fish in 2014, which is a $15 \%$ decrease from 2013 ( 8.54 million fish), but a $40 \%$ increase from 2012 ( 5.19 million fish) (Figure 6; Table 7). The 2014 recreational catch estimate of 9.07 million fish is the $4^{\text {th }}$ lowest on record since 1995, and represents a $65 \%$ decline from the peak in 2006 ( 26.13 million fish; Figure 9). Anglers are keeping more of the fish they catch in recent years or catching fewer sub-legal fish. The proportion of catch that is released was $80 \%$ in 2014. Using a $9 \%$ post-release mortality rate, recreational dead discards are estimated to be 655,429 fish in 2014. Total recreational removals (harvest and dead discards combined) in 2014 was 2.44 million fish, which is a $15 \%$ decrease from 2013 ( 2.89 million fish). Maryland landed the largest percentage of the coastwide recreational harvest in number of fish (33\%), followed by New York (23\%), Massachusetts (16\%), New Jersey (13\%), and Rhode Island $(6 \%)$. The remaining states each landed $5 \%$ or less of the 2014 recreational landings by number of fish.

## Albemarle Sound and Roanoke River Management Areas

Total commercial and recreational harvest in the ASMA and RRMA in 2014 was 121,956 pounds (31,114 fish). Commercial harvest in the ASMA was 71,372 pounds (14,258 fish). Recreational harvest in the ASMA was 16,867 pounds ( 5,528 fish), while recreational harvest in the RRMA was 33,717 pounds ( 11,058 fish). The majority of harvest was fish three - six years old.

## IV. Status of Assessment Advice

The 2013 Atlantic Striped Bass benchmark stock assessment was peer reviewed at the $57^{\text {th }}$ SAW/SARC, and approved by the Board for management use in October 2014. The SARC acknowledged that the stock assessment team (i.e., the Technical Committee, Tagging Subcommittee, and the Stock Assessment Subcommittee) was able to address several of the recommendations from the last benchmark assessment peer reviewed at the $46^{\text {th }}$ SAW in 2007 (NEFSC 2013a, NEFSC 2013b). Most notably, the stock assessment team re-estimated target and threshold F that link with the target and threshold SSB, and made progress in addressing the spatial dynamics of the stock by splitting total removals into three "fleets;" an ocean fleet, a Chesapeake Bay fleet and a commercial discard fleet. Other improvements include incorporating error in the catch estimation into the model, re-evaluating key parameters including natural mortality, release mortality rates, and tag reporting rates, improving SCA model fit diagnostics, incorporating the stock-recruit relationship into the SCA and reference point models, and exploring different models for selectivity in the plus age group. The 2013 SCA model also directly incorporates ageing error based on the assessment team's work on scale-otolith comparisons.

Additionally, the SARC identified high priority items for consideration in future assessments including continued improvement of the spatial modeling of the stock, and incorporating tagging data.

The Technical Committee's next Atlantic Striped Bass stock assessment update will be available for review by the Board at its November 2015 meeting. The next benchmark stock assessment for Striped Bass is scheduled for 2018.

## V. Status of Research and Monitoring

Amendment 6 and its Addenda I-III set the regulatory and monitoring measures for the coastwide Striped Bass fishery in 2013 and 2014.

The management plan requires certain jurisdictions to implement fishery-dependent monitoring programs for Striped Bass. All jurisdictions with commercial fisheries or substantial recreational fisheries are required to define the catch and effort composition of these fisheries. Additionally, all states and jurisdictions with a commercial fishery must implement a commercial tagging program pursuant to Addendum III to Amendment 6.

The management plan also requires certain states to monitor the Striped Bass population independent of the fisheries. Juvenile abundance indices are required from Maine (Kennebec River), New York (Hudson River), New Jersey (Delaware River), Maryland (Chesapeake Bay tributaries), Virginia (Chesapeake Bay tributaries), and North Carolina (Albemarle Sound). Spawning stock sampling is mandatory for New York (Hudson River), Pennsylvania (Delaware River), Delaware (Delaware River), Maryland (Upper Chesapeake Bay and Potomac River), Virginia (Rappahannock River and James River), and North Carolina (Roanoke River and Albemarle Sound). Amendment 6 requires NOAA Fisheries, USFWS, Massachusetts, New York, New Jersey, Maryland, Virginia, and North Carolina to continue their tagging programs, which provide data used to determine survivorship and migration patterns.

## VI. Status of Management Measures and Issues

## Coastal Commercial Quota

In 2014, one state had a coastal commercial quota lower than their Amendment 6 allocation due to quota overages in 2013 (Massachusetts exceeded their quota by 6,591 pounds resulting in an effective quota of $1,153,159$ ). In 2014, all states' coastal commercial harvests were below their coastal commercial quota. Addendum IV coastal commercial quotas will be implemented for 2015, as listed in Table 8.

## Chesapeake Bay Quota

Amendment 6 includes a separate management program for the Chesapeake Bay due to the size availability of Striped Bass in this area. Based on the previous target fishing mortality rate of $\mathrm{F}=0.27$, Maryland, Virginia, and the Potomac River Fisheries Commission (PRFC) annually establish a bay-wide quota for resident fish using the Harvest Control Model (Table 9). In 2014, the bay-wide quota was $8,652,527$ pounds. Shares are allocated to Maryland, the PRFC, and Virginia based on historical harvest, and each jurisdiction then allocates portions of the quota to its recreational and commercial fisheries. In 2014, the bay-wide harvest was $7,303,699$ pounds and within the quota.

## Chesapeake Bay Spring Trophy Fishery

Recreational fishermen in the Chesapeake Bay are permitted to take adult migrant fish during a limited seasonal fishery, commonly referred to as the Spring Trophy Fishery. From 1993 to 2007 the fishery operated under a quota. Beginning in 2008, the Board approved non-quota management until stock assessment indicates that corrective action is necessary to reduce F on the coastal stock. The Spring Trophy Fishery is managed via bag limits and size restrictions.

In 2014, the estimate of migrant fish harvested during the trophy season was 38,921 fish $(38,910$ fish in Maryland and 11 fish in Virginia [2015 state compliance reports]) and represents a $20 \%$ decrease from 2013. Harvest of migrant Striped Bass in the spring fishery in 2014 was below the average over the last 5 years (2009-2013; 42,765 fish). In Maryland in 2014, charter boats harvested $32 \%$ while private anglers harvested $68 \%$ of the total.

## Wave-1 Recreational Harvest Estimates

Evidence suggests that North Carolina, Virginia, and possibly other states have had sizeable wave1 (January/February) recreational Striped Bass fisheries beginning in 1996 (NEFSC 2013b). The Marine Recreational Information Program (MRIP), formerly the Marine Recreational Fisheries Statistics Survey (MRFSS), has sampled for Striped Bass in North Carolina during wave-1 since 2004. Other states are not currently covered during wave-1.

However, Striped Bass distributions on their overwintering grounds during January through February has changed significantly since the mid-2000s. The migratory portion of the stocks has been well offshore in the EEZ off Virginia and North Carolina (up to 27 miles) in recent years. North Carolina has reported zero striped bass landings in the ocean for 2012-2014.

## Juvenile Abundance Indices

Amendment 6 requires the following states to conduct Striped Bass young-of-year juvenile abundance index (JAI) surveys on an annual basis: Maine for the Kennebec River; New York for the Hudson River; New Jersey for the Delaware River; Maryland for the Maryland Chesapeake Bay tributaries; Virginia for the Virginia Chesapeake Bay tributaries; and North Carolina for the Albemarle Sound/Roanoke River stock. Refer to Figure 10 for the results of the juvenile abundance surveys.

The Striped Bass Technical Committee (TC) annually reviews trends in all required JAIs. Under Amendment 6, recruitment failure was defined as a value that was lower than 75 percent of all the other values in the dataset for three consecutive years. This methodology created a constantly moving value with each additional year of data. Under the new definition of recruitment failure, per Addendum II to Amendment 6, recruitment failure is defined as a value that is below $75 \%$ (the first quartile, or Q1) of all values in a fixed time series appropriate to each JAI. If any survey's JAI falls below their respective Q1 for three consecutive years, then appropriate action should be recommended by the TC to the Management Board. The Management Board is the final arbiter in all management decisions.

For the 2015 review of JAIs the analysis evaluates the 2012, 2013, and 2014 JAI values. No state's JAI met the criteria for recruitment failure, but every state's JAI except Maine has had at least one value within the last three years fall below the Q1 threshold (Figure 10).

The JAI for the Hudson River was below its Q1 threshold for 2012 and 2013, but well above average for 2014. Similarly the Delaware River JAI was below its Q1 threshold in 2012, slightly above the Q1 in 2013, and well above average for 2014. The Maryland Chesapeake Bay JAI was near zero in 2012, followed by the past two years' value near the long-term average. The Virginia Chesapeake Bay JAI showed a similar trend with the 2012 value below its Q1 and the 2013 and 2014 values above the survey's long-term average. North Carolina's JAI for the Albemarle

Sound/Roanoke River stock was near its Q1 threshold in 2012, below its Q1 and near zero in 2013, and the 2014 value well above average, ranking $9^{\text {th }}$ in the sixty-year time series.

## Albemarle/Roanoke Striped Bass FMP

The Interstate FMP for Atlantic Striped Bass requires North Carolina to inform the Commission of changes to Striped Bass management in the Albemarle Sound/Roanoke River (A/R) System. North Carolina must adhere to the compliance criteria in Amendment 6. After a Technical Committee review, the PRT previously determined that North Carolina's FMP complies with the mandatory components of Amendment 6.

Estuarine Striped Bass (Morone saxatilis) in North Carolina are currently managed under Amendment 1 to the North Carolina Estuarine Striped Bass Fishery Management Plan (FMP) and its subsequent revision (NCDMF 2014). It is a joint plan between the North Carolina Marine Fisheries Commission (NCMFC) and the North Carolina Wildlife Resources Commission (NCWRC). Amendment 1, adopted in 2013, lays out separate management strategies for the Albemarle/Roanoke (A/R) stock and the largely non-migratory Central and Southern stocks in the Tar/Pamlico, Neuse, and Cape Fear rivers. Management programs in Amendment 1 utilize annual total allowable landings (TAL), daily possession limits, open and closed harvest seasons, gill net mesh size and yardage restrictions, seasonal attendance requirements, barbless hook requirements in some areas, minimum size limits, and slot limits to maintain a sustainable harvest and reduce regulatory discard mortality in all sectors. Amendment 1 also maintains the stocking regime in the Central and Southern systems and the harvest moratorium on Striped Bass in the Cape Fear River and its tributaries (NCDMF 2013). Striped Bass fisheries in the Atlantic Ocean of North Carolina are managed under ASMFC's Amendment 6 and subsequent addenda to the Interstate FMP for Atlantic Striped Bass.

In response to the results of the 2013 benchmark A/R Striped Bass stock assessment that indicated fishing mortality was above its target, the NCMFC approved a Revision to Amendment 1 in November 2014 (NCDMF 2014). The revision reduced the Total Allowable Landings (TAL) for the A/R stock from 550,000 pounds to 275,000 pounds, to be split evenly between the commercial and recreational sectors. Stock assessment projections indicated a TAL of 275,000 pounds would maintain fishing mortality and spawning stock at their respective targets and provide a sustainable harvest. The Central and Southern stocks continue to be managed under a 25,000 pounds commercial TAL, daily possession limits and a closed summer season to control recreational harvest, and a total harvest moratorium in the Cape Fear River and its tributaries.

## Law Enforcement Reporting

No law enforcement cases were described in the 2014 and 2015 compliance reports, however, that does not necessarily imply that no Striped Bass law enforcement violations occurred in 2013 and 2014. Staff is working with the Law Enforcement Committee to compile law enforcement citations, if any, for the 2016 FMP review.

## VII. Annual State Compliance

Based on the annual state compliance reports, the Plan Review Team (PRT) determined that each state/jurisdiction implemented a management program for 2013 and 2014 that was approved by
the Striped Bass Management Board and was consistent with the requirements of Amendment 6. Refer to Tables 1 and 2 for 2014 Striped Bass fishing regulations by state.

Amendment 6 includes compliance requirements for monitoring programs (summarized in Section $V$ ). Compliance with these requirements is summarized in Table 11. The PRT found that all states carried out the required monitoring programs in the 2013 and 2014 fishing year. No monitoring program changes were documented in the 2014 or 2015 compliance reports, or provided via personal communication.

Addendum III to Amendment 6 includes compliance requirements for monitoring commercial fishery tagging programs. The PRT found that all states implemented commercial tagging programs consistent with the requirements of Addendum III. Table 10 describes each state's program requirements.

The following management program changes were documented for the 2014 season:

- MD- The 2014 commercial fishery was transitioned to an ITQ system. A small number of commercial fishermen opted out of the ITQ fishery and are regulated under the old system with a portion of the quota set aside, referred to as the "Common Pool."
- MA- The 2014 commercial season did not open until June 24, and harvesting was allowed on Monday and Thursday only with a daily bag limit of 2 fish for those with rod-reel or individual permits, or 15 fish for those with boat permits.

## VIII. Recommendations

## Research Recommendations

## Fishery-Dependent Priorities

High

- Continue collection of paired scale and otolith samples, particularly from larger Striped Bass, to facilitate development of otolith-based age-length keys and scale-otolith conversion matrices. ${ }^{1}$

## Moderate

- Develop studies to provide information on gear specific discard morality rates and to determine the magnitude of bycatch mortality. ${ }^{2}$
- Improve estimates of Striped Bass harvest removals in coastal areas during wave 1 and in inland waters of all jurisdictions year round.
- Evaluate the percentage of fishermen using circle hooks. ${ }^{3}$

## Fishery-Independent Priorities

## Moderate

- Develop a refined and cost-efficient, fisheries-independent coastal population index for Striped Bass stocks.
- The PRT recommends the SBTC be tasked with exploring whether the Cooperative Winter Tagging Cruise, NEAMAP, and/or NMFS Trawl Survey datasets would prove useful in this respect.

## Modeling / Quantitative Priorities

High

- Develop a method to integrate catch-at-age and tagging models to produce a single estimate of F and stock status. ${ }^{4}$
- Develop a spatially and temporally explicit catch-at-age model incorporating tag based movement information. ${ }^{5}$
- The PRT recommends that the SAS be tasked with reviewing recent published literature examining tag-based movement information to see if they would contribute to the development of such a model (e.g., Callihan et al. 2014)
- Review model averaging approach to estimate annual fishing mortality with tag based models. Review validity and sensitivity to year groupings. ${ }^{6}$
- Develop methods for combining tag results from programs releasing fish from different areas on different dates.
- Examine potential biases associated with the number of tagged individuals, such as gear specific mortality (associated with trawls, pound nets, gill nets, and electrofishing), tag induced mortality, and tag loss. ${ }^{7}$
- Develop field or modeling studies to aid in estimation of natural mortality or other factors affecting the tag return rate.

## Moderate

- Develop maturity ogives applicable to coastal migratory stocks.
- Examine methods to estimate annual variation in natural mortality. ${ }^{8}$
- Develop reliable estimates of poaching loss from Striped Bass fisheries.
- Improve methods for determining population sex ratio for use in estimates of SSB and biological reference points.
- Evaluate truncated matrices and covariate based tagging models.

## Low

- Examine issues with time saturated tagging models for the 18 inch length group.
- Develop tag based reference points.

## Life History, Biological, and Habitat Priorities

High

- Continue in-depth analysis of migrations, stock compositions, etc. using mark-recapture data. ${ }^{9}$
- Continue evaluation of Striped Bass dietary needs and relation to health condition. ${ }^{10}$
- Continue analysis to determine linkages between the mycobacteriosis outbreak in Chesapeake Bay and sex ratio of Chesapeake spawning stock, Chesapeake juvenile production, and recruitment success into coastal fisheries.

## Moderate

- Examine causes of different tag based survival estimates among programs estimating similar segments of the population.
- Continue to conduct research to determine limiting factors affecting recruitment and possible density implications.
- Conduct study to calculate the emigration rates from producer areas now that population levels are high and conduct multi-year study to determine inter-annual variation in emigration rates.

## Low

- Determine inherent viability of eggs and larvae.
- Conduct additional research to determine the pathogenicity of the IPN virus isolated from Striped Bass to other warm water marine species, such as flounder, menhaden, shad, and largemouth bass.

## Management, Law Enforcement, and Socioeconomic Priorities

## Moderate

- Examine the potential public health trade-offs between the continued reliance on the use of high minimum size limits ( 28 inches) on coastal recreational anglers and its long-term effects on enhanced PCB contamination among recreational stakeholders. ${ }^{11,13}$
- Evaluate Striped Bass angler preferences for size of harvested fish and trade-offs with bag limits.

## Habitat Recommendations

- Passage facilities should be designed specifically for passing Striped Bass for optimum efficiency at passing this species.
- Conduct studies to determine whether passing migrating adults upstream earlier in the year in some rivers would increase Striped Bass production and larval survival, and opening downstream bypass facilities sooner would reduce mortality of early emigrants (both adult and early-hatched juveniles).
- All state and federal agencies responsible for reviewing impact statements and permit applications for projects or facilities proposed for Striped Bass spawning and nursery areas shall ensure that those projects will have no or only minimal impact on local stocks, especially natal rivers of stocks considered depressed or undergoing restoration. ${ }^{11}$
- Federal and state fishery management agencies should take steps to limit the introduction of compounds which are known to be accumulated in Striped Bass tissues and which pose a threat to human health or Striped Bass health.
- Every effort should be made to eliminate existing contaminants from Striped Bass habitats where a documented adverse impact occurs.
- Water quality criteria for Striped Bass spawning and nursery areas should be established, or existing criteria should be upgraded to levels that are sufficient to ensure successful Striped Bass reproduction.
- Each state should implement protection for the Striped Bass habitat within its jurisdiction to ensure the sustainability of that portion of the migratory stock. Such a program should include: inventory of historical habitats, identification of habitats presently used, specification of areas targeted for restoration, and imposition or encouragement of measures to retain or increase the quantity and quality of Striped Bass essential habitats.
- States in which Striped Bass spawning occurs should make every effort to declare Striped Bass spawning and nursery areas to be in need of special protection; such declaration should be accompanied by requirements of non-degradation of habitat quality, including minimization of non-point source runoff, prevention of significant increases in contaminant loadings, and prevention of the introduction of any new categories of contaminants into the area. For those agencies without water quality regulatory authority, protocols and schedules for providing input on water quality regulations to the responsible agency should be identified or created, to ensure that water quality needs of Striped Bass stocks are met. ${ }^{12}$
- ASMFC should designate important habitats for Striped Bass spawning and nursery areas as HAPC.
- Each state should survey existing literature and data to determine the historical extent of Striped Bass occurrence and use within its jurisdiction. An assessment should be conducted of those areas not presently used for which restoration is feasible.

## Footnotes

- ${ }^{1}$ The Fish and Wildlife Service has archived otolith samples from known-age (CWT-tagged), stocked fish, for which scale ages were derived as well. These fish were collected during past Cooperative Winter Tagging Cruises and the otoliths, once aged, will increase our sample size, and since these are known-age fish, will also allow an examination of extent that which reader error affects both otolith age, and scale age.
- ${ }^{2}$ Literature search and some modeling work completed.
- ${ }^{3}$ Work ongoing in New York through the Hudson River Angler Diary, Striped Bass Cooperative Angler Program, and ACCSP e-logbook.
- ${ }^{4}$ Model developed, but the tagging data overwhelms the model. Issues remain with proper weighting.
- ${ }^{5}$ Model developed with Chesapeake Bay and the rest of the coast as two fleets. However, no tagging data has been used in the model.
- ${ }^{6}$ Work ongoing by Striped Bass Tagging Subcommittee to evaluate the best years to use for the IRCR and the periods to use for the MARK models.
- ${ }^{7}$ Gear specific survival being examined in Hudson River.
- ${ }^{8}$ Ongoing work by the Striped Bass Tagging Subcommittee
- ${ }^{9}$ Ongoing through Cooperative Winter Tagging Cruise and Striped Bass charter boat tagging trips. See Cooperative Winter Tagging Cruise 25 Year Report, in preparation.
- ${ }^{10}$ Plans for a stomach content collection program in the Chesapeake Bay by the Chesapeake Bay Ecological Foundation.
- ${ }^{11}$ Ongoing in New York.
- ${ }^{12}$ Significant habitat designations completed in the Hudson River and New York Marine Districts.
- ${ }^{13}$ Samples collected from two size groups ( $\geq 28$ inches and 20-26 inches) in Pennsylvania and processed by the Department of Environmental Protection to compare contamination of the two size groups.

## Plan Review Team Recommendations

- The PRT found that all states implemented regulations consistent with Amendment 6 and Addenda I-III of the Atlantic Striped Bass FMP, and recommends the Board accept the 2015 FMP Review of the 2013 and 2014 fishing seasons.
- The PRT recommends that all states submit commercial tagging reports no later than 60 days prior to the start of the first commercial fishery in that state or jurisdiction, as described in Addendum III to Amendment 6.
- No states requested de minimis status at this time.

Table 6. Recreational harvest (numbers) of Atlantic Striped Bass by state, 1982-2014
Source: MRIP queried June 26, 2015. Note: All harvests based on the calendar year. Estimates are for March to December except for North Carolina. Maryland and Virginia harvests include Chesapeake Bay. North Carolina is Atlantic Ocean only. The table includes wave 1 estimates of harvest (January-February) if MRIP estimated weight for wave 1.

| Chesapeake Bay Total |  |  |  |

Note: Recreational harvest in the Potomac River is included in Maryland and Virginia harvest estimates. Estimates of recreational harvest in Maryland do not include migratory fish harvested in the spring season. These fish are not counted against Maryland's portion of the Chesapeake Bay recreational quota. The 2014 migratory harvest is estimated at 38,921 fish. The PRFC recreational quota includes the charter boat quota of 65,874 pounds.

$\wedge$ MA was granted an extension through Addendum III and mandated to implement a commercial tagging program prior to start of 2014 fishing year.

* MD changed tag color scheme in 2014 from five to three which reflects commercial fishery transition to an ITQ system between 2013 and 2014 fishing seasons.
${ }^{0}$ Sates are required to allocate commercial tags to permit holders based on a biological metric. Most states used the average weight per fish from the previous year, or some variation thereof. Actual biological metric used is to be included in State Annual Commercial Tag Reports.

Table 11. Status of compliance with monitoring and reporting requirements, 2014
( $\mathrm{JAI}=$ juvenile abundance index survey, $\mathrm{SSB}=$ spawning stock biomass survey, tag = participation in coastwide tagging program, $\mathrm{Y}=$ compliance standards met, $\mathrm{N}=$ compliance standards not met, na $=$ not applicable)

| Jurisdiction | Fishery-independent monitoring |  | Fishery-dependent monitoring |  | Annual reporting |
