## I. Status of the Fishery Management Plan

The Atlantic States Marine Fisheries Commission (Commission) adopted its first Fishery Management Plan (FMP) for Weakfish in 1985. Amendment 1 to the FMP (1992) unsuccessfully aimed to improve the status of weakfish. Amendment 2 (1995) resulted in some improvement to the stock, but several signs indicated that further improvement was necessary. Thus, Amendment 3 (1996) was implemented to increase the sustainability of the fishery. Addendum I to Amendment 3 was approved in 2000 in order to extend the existing management program until the Weakfish Management Board (Board) could approve Amendment 4.

Weakfish are currently managed under the guidelines contained in Amendment 4 (2002). The Commission adopted Addendum I to Amendment 4 (2005) to replace the biological sampling program in section 3.0 of Amendment 4. In response to a significant decline in stock abundance and increasing total mortality since 1999, the Board approved Addendum II to Amendment 4 (2007) to reduce the recreational creel limit and commercial bycatch limit, and set landings levels that when met will trigger the Board to re-evaluate management measures. Addendum III to Amendment 4 (2007) altered the bycatch reduction device certification requirements in Section 4.2.8 of Amendment 4 for consistency with the South Atlantic Fishery Management Council's Shrimp FMP.

The goal of Amendment 4 is to utilize interstate management so that Atlantic coastal weakfish recover to healthy levels that will maintain commercial and recreational harvest consistent with a self-sustaining spawning stock and to provide for restoration and maintenance of essential habitat (ASMFC 2002). The management objectives are to:

1) establish and maintain an overfishing definition that includes target and threshold fishing mortality rates and a threshold spawning stock biomass to prevent overfishing and maintain a sustainable weakfish population;
2) restore the weakfish age and size structure to that necessary for the restoration of the fishery;
3) return weakfish to their previous geographic range;
4) achieve compatible and equitable management measures among jurisdictions throughout the fishery management unit, including states' waters and the federal EEZ;
5) promote cooperative interstate research, monitoring, and law enforcement necessary to support management of weakfish;
6) promote identification and conservation of habitat essential for the long term stability in the population of weakfish; and
7) establish standards and procedures for both the implementation of Amendment 4 and for determination of states' compliance with provisions of the management plan.

Amendment 4 defines overfishing through the use of target and threshold fishing mortality rates ( $\mathrm{F}_{30 \%}=\mathrm{F}=0.31$ and $\mathrm{F}_{20 \%}=\mathrm{F}=0.50$, respectively) and a threshold spawning stock biomass $\left(\mathrm{SSB}_{20 \%}=31.8\right.$ million pounds). In order to achieve annual fishing mortality targets, recreational harvest of weakfish is constrained by a combination of size limits and possession limits, and commercial harvest by size limits, gear restrictions, and possibly season and/or area closures. After approval, states may request implementation of alternative management plans with conservationally equivalent measures.

Weakfish are managed under this plan as a single stock throughout their coastal range. All Atlantic coast states from Massachusetts through Florida and the Potomac River Fisheries Commission have a declared interest in weakfish. See Table 1 for a summary of state-by-state regulations. Responsibility for the FMP is assigned to the Weakfish Management Board, Plan Review Team, Technical Committee, Stock Assessment Subcommittee, and Advisory Panel.

## II. Status of the Stock

A weakfish stock assessment of data through 1998 was conducted in 1999 and peer reviewed at the $30^{\text {th }}$ Northeast Regional Stock Assessment Workshop (NMFS 2000). This report indicated that weakfish were at a high level of abundance and subject to low fishing mortality rates. This assessment was updated in 2002 with data through 2000 (Kahn 2002). The assessment suggested that the management measures put in place in Amendment 3 had resulted in positive trends for the weakfish population. However, the report also noted that the absolute magnitude of impact should be viewed with caution given the uncertainty of the fishing mortality and spawning stock biomass estimates for the most recent year of the assessment (which is often the case with final year estimates).

While these traditional single species assessments were generating high stock size estimates, the recreational and commercial landings of weakfish along the Atlantic coast plummeted to all-time lows between 1999 and 2003. This dichotomy of assessment results and fishery performance lead the Weakfish Technical Committee to consider less traditional assessment techniques in its most recent stock assessment covering the period of 1982-2003 (Kahn and others 2006).

Results from the alternative approaches revealed that a large rise in natural mortality starting in the mid-1990s largely caused weakfish biomass and size structure to decline greatly by 2003 (Figure 1). These declines could not be attributed to a slight rise in fishing mortality, which had fallen to moderate levels by 1994 due to conservative management measures. The Technical Committee noted that the rapid decline in biomass starting in the late 1990s was reminiscent of rapid transitions between extended periods of high or low commercial landings dating back to the late 1920s. In theory, these rapid changes could reflect an underlying environmental driver, the effect of which could have been accelerated by high fishing or predation rates.

Therefore, the Technical Committee developed and tested specific hypotheses to evaluate candidate predator/competitors (striped bass, summer flounder, bluefish, spiny dogfish and Atlantic croaker), forage species (Atlantic menhaden, bay anchovy, and spot), environmental factors (water temperature and North Atlantic Oscillation index), high bycatch losses, and overfishing (Kahn and others 2006, Uphoff 2006). Insufficient forage, especially Atlantic menhaden, and increased predation by striped bass emerged as leading hypotheses supporting rising natural mortality as cause for stock decline (Figure 2), but contributions by other species or factors may not have been completely detected or tested. While this result does not provide much leverage for recovery by managing the fishery alone, projections did indicate that cuts in fishing mortality are needed for timely recovery if natural mortality declines.

While this assessment was not upheld by an external peer review panel, the Board accepted for management use five conclusions from the report: 1) the stock is declining; 2) total mortality is increasing; 3) there is not much evidence of overfishing; 4) something other than fishing mortality is causing the decline in the stock; and 5) there is a strong chance that regulating the
fishery will not, in itself, reverse stock decline. The Commission has therefore labeled the status of weakfish as: depleted, overfishing not occurring.

## III. Status of the Fishery

At 1.48 million pounds, the total coastwide landings of weakfish in 2007 are the lowest on record from at least 1982 (Table 2). Total landings dropped $25 \%$ from the 2006 landings of 1.98 million pounds, and $78 \%$ from the ten-year (1997-2006) average of 6.73 million pounds. The commercial fishery ( 899,045 pounds) accounts for $61 \%$ of the total 2007 landings, and the recreational fishery (581,222 pounds) for 39\% (Table 2).

## Commercial Fishery

Commercial data are cooperatively collected and compiled by the National Marine Fisheries Service (NMFS) and state fishery agencies from state mandated trip-tickets, landing weigh-out reports from seafood dealers, federal logbooks, shipboard and portside interviews, and biological sampling of catches. Landings from the NMFS Fisheries Statistics Division are used within this report unless a state reports alternative values in its compliance report to the Commission, in which case these values are used (see notes for Table 3).

Between 1982 and 2007, coastwide commercial weakfish landings have ranged from the high of 21.1 million pounds in 1986 to the low of 899,045 pounds in 2007 (Table 3). Since 1988, the overall trend is declining, except for during the period of 1990-1998 when landings hovered between 6.1 and 9.1 million pounds (Figure 3).

Virginia (45\%), North Carolina (20\%), and New Jersey (18\%) dominated the 2007 commercial weakfish landings (Table 3, Figure 4). Except for in 2007, North Carolina has annually landed the most weakfish since 1982 and Virginia has consistently landed the second most since 1993.

The dominant commercial gears used include gill nets, trawls, pound nets, and haul seines (about $52 \%, 18 \%, 8 \%$ and $7 \%$, respectively, of the total commercial landings in 2007; NMFS 2008). There has been a shift in the dominant source of landings from trawls in the 1950s-1980s to gill nets in the 1990s-present. The majority of commercial landings tend to occur in the fall and winter months, presumably as the fish congregate to migrate to over-wintering grounds in the South Atlantic (Hogarth and others 1995).

## Recreational Fishery

Recreational catch statistics are collected by the NMFS. Effort data is collected through telephone interviews. Catch expansions are based on angler interviews and biological sampling conducted by trained interviewers stationed at fishing access sites. All recreational data in this report are from the NMFS Fisheries Statistics Division.

Since 1982, coastwide recreational landings have ranged from the high of 11.5 million pounds in 1983 to the low of 581,222 pounds in 2007 (Table 4). Landings averaged 7.9 million pounds from 1982-1988, before falling to 2.1 million pounds in 1989. Annual recreational landings fluctuated between 1.0 and 4.1 million pounds from 1990 to 2002, before dropping below 1 million pounds for the first time in 2003 (Figure 3). Landings have averaged 940 thousand pounds (or 767 thousand fish) the last five years (Table 5). The number of fish released alive by
anglers has remained above 1 million fish since 1993, peaking at over 5 million in 1996, and decreasing to 1.4 million fish in 2007 (Table 6, Figure 5).

New Jersey anglers have nearly consistently harvested the most weakfish by pounds along the coast. In the 1980s and 1990s, Delaware anglers often took the second largest amount, with Maryland or Virginia anglers often taking the third and forth largest amounts. In the 2000s, New Jersey anglers still lead in the harvest by pounds, whereas anglers in Virginia or North Carolina tend to take the second and third largest amounts (Tables 4 and 5). In 2007, New Jersey anglers landed $51 \%$ of the coastwide harvest, followed by North Carolina anglers with $22 \%$ and Virginia anglers with 8\% (by pounds; Figure 6).

The recreational fishery catches weakfish using live or cut bait, jigging, trolling, and chumming, mostly in state waters. In 2007, nearly all recreationally harvested fish were caught from private or rental boats (69\%), or from shore (29\%; NMFS 2008). Ninety-six percent of the harvest occurred in waves three through six (May-December).

## IV. Status of Assessment Advice

Besides virtual population analyses, the Weakfish Stock Assessment Subcommittee has been exploring other approaches for future assessments including using a separable virtual population analysis and relative exploitation. The most recent weakfish stock assessment used a relative exploitation model due to the inconsistency between VPA results and recent landings trends. The Board has approved the continued exploration of multiple approaches for the next weakfish stock assessment, scheduled for peer review in 2009 through a Northeast Regional Stock Assessment Workshop. The Technical Committee will also be developing additional qualitative techniques for tracking management progress between assessments, as tasked by the Board.

## V. Status of Research and Monitoring

## Fishery-Independent Data

Young-of-year indices of relative abundance are provided by Connecticut, New York, Delaware, Maryland, Virginia, North Carolina, and Florida. Rhode Island, Connecticut, New Jersey, Delaware, North Carolina, and Florida provide age-1 or 1+ indices of relative abundance. The Northeast Fisheries Science Survey Groundfish Trawl Survey also produces an age-structured index for the Mid-Atlantic coast, while the Southeast Area Monitoring and Assessment Program (SEAMAP) produces another for the South Atlantic Coast. The Northeast Area Monitoring and Assessment Program (NEAMAP) began spring and fall surveys between Martha’s Vineyard and Cape Hatteras in the fall of 2007, and will provide an index in the future. The Chesapeake Bay Multispecies Monitoring and Assessment Program (ChesMMAP), which began in 2002, collects data on relative abundance, length, weight, age, sex, and trophic interactions in the Bay. See Table 9 for the indices provided in the 2007 compliance reports.

## Fishery-Dependent Data

The coastal states and the NMFS collect data on commercial and recreational landings. Addendum I to Amendment 4 requires the collection of otoliths and lengths to characterize the catch; the number of samples required is based on the magnitude of each state's fisheries. Each spring, the states are required to submit biological sampling plans, and each fall, through the
compliance reports, the states are required to provide the actual sampling levels completed. See Section VII for more information.

## VI. Status of Management Measures and Issues

## Fishery Management Plan

The Board approved two addenda to Amendment 4 in 2007. First, Addendum II was approved on February 1, 2007, with an implementation date of October 29, 2007. Second, Addendum III was approved on May 8, 2007 to be effective immediately. No additional amendments or addenda are under development.

## De Minimis Status

Amendment 4 permits states to request de minimis status if, for the last two years, their combined average commercial and recreational landings (by weight) constitute less than $1 \%$ of the coastwide commercial and recreational landings for the same two year period. The de minimis threshold for 2007, calculated with 2006 and 2007 harvest data, is 17,289 pounds.

Five states requested de minimis status in their 2008 compliance reports: Florida, Georgia, South Carolina, Connecticut, and Massachusetts. Each of these states has had a previous de minimis request approved. Georgia ( $0.21 \%$ ), Connecticut ( $0.26 \%$ ), and Massachusetts ( $0.25 \%$ ) are below the $1 \%$ landings criterion, while Florida (1.46\%) and South Carolina (1.57\%) are not. This is South Carolina's forth year of being above the $1 \%$ level and requesting continued de minimis status, claiming error in the MRFSS estimates. This is Florida’s first year of being above the $1 \%$ level and requesting continued de minimis status, claiming that the state's proportional increase is largely the consequence of declining harvest in the core distribution area of the species. The weakfish-sand seatrout hybridization issue also brings an element of uncertainty to Florida’s landings.

The Board approved the de minimis requests of all five states on October 21, 2008.

## Addendum II Management Triggers

Addendum II established two management triggers that would require the Board to consider modifying management measures if reached. Commercial management measures are to be reevaluated if coastwide commercial landings exceed $80 \%$ of the mean commercial landings from 2000-2004, or 2.99 million pounds. Commercial and recreational management measures are to be re-evaluated if any single state's landings exceed its five-year mean by more than $25 \%$ in any single year.

The 2007 coastwide commercial landings are 899,045 pounds, thus the first trigger has not been exceeded. The second trigger is reached for one state (Table 7). Florida's 2007 total landings are 31,104 pounds, a $109 \%$ increase from the state's 2002-2006 average total landings of 14,893 pounds. The PRT notes that Florida also met this trigger in 2006 with its harvest of 19,227 pounds being a $43 \%$ increase over the state's 2001-2005 average total landings of 13,410 pounds.

The Board determined that it was not necessary to consider changes to the management plan on October 21, 2008.

## VII. Implementation of FMP Compliance Requirements for 2007

Mandatory compliance elements for 2007 are provided by Amendment 4 and its three addenda.

## Regulatory Requirements

The management program includes regulatory requirements for non de minimis states as follows:

- Recreational management measures including maximum creel limits and minimum size limits (see Addendum II to Amendment 4)
- Commercial management measures including minimum size limits, minimum mesh size limits, trip limits, bycatch limits, closed seasons and areas, and bycatch reduction device requirements (see Section 4.2 of Amendment 4, and Addendum II)

The PRT found all states to have implemented the management program's regulatory requirements, except for New York. As of September 29, 2008, New York had not implemented the 150 pound bycatch limit for non-directed fisheries, as required by Addendum II to Amendment 4. On October 21, 2008, the Management Board was notified that the New York State Department of Environmental Conservation Commissioner signed a rule on October 8, 2008 to reduce its bycatch limit. The rule was submitted to the Department of State for formal filing, which may take several weeks.

See Table 1 for a summary of state commercial and recreational regulations in 2007.

## Monitoring Requirements

Addendum I implemented monitoring requirements for non de minimis states as follows:

- Maintenance of at least the 2005 level of recreational sampling of individual lengths through the Marine Recreational Fisheries Statistics Survey;
- Collection of six individual fish lengths for each metric ton of weakfish landed commercially;
- Collection of three individual fish ages for each metric ton of total weakfish landed, with a maximum of 1000 ages annually per state.

Table 8 provides the otolith and length collection requirements for 2007. These are based on the best available 2007 landings data provided to the Commission by the NMFS and the states. Table 8 also provides the number of otoliths and lengths collected by the states in 2007. Three states did not fulfill the requirements of Addendum I in 2007: Rhode Island (otoliths and lengths), New York (otoliths and lengths), New Jersey (otoliths), and Virginia (otoliths). The states have noted that funding issues, personnel shortages, and the problem of sampling from a fishery with low landings has led to their inability to collect the required number of samples.

Addendum I specifies that if the Board determines that a state has not successfully implemented the required biological sampling program the state will be prohibited from harvesting weakfish until it develops, and the Board approves, a plan to collect the required samples the following year. Each state has submitted a sampling plan for 2008 that has been approved by the Board. The Board may also choose to forward a recommendation of non-compliance to the Policy Board for consideration.

The Board did not recommend finding any states out of compliance on October 21, 2008.

## VIII. Recommendations of the Plan Review Team

## Management Recommendations

- That the Board consider the de minimis requests of Massachusetts, Connecticut, South Carolina, Georgia, and Florida, noting that South Carolina (for the fourth year) and Florida (for the first year) do not technically qualify. Regarding South Carolina's difficulty with MRFSS estimates, the PRT would advise that South Carolina resolve the issue directly with the NMFS Fisheries Statistic Division.
- That the Board consider if any action is necessary in response to the Addendum II management triggers, noting that Florida has activated the total landings trigger for two consecutive years.
- That the Board consider the compliance of Rhode Island, New York, New Jersey, and Virginia with the monitoring requirements in 2007.
- That the Board consider the permissible sources of lengths and otoliths required through Addendum I. The PRT judges the intent of Addendum I to be requiring biological samples from the commercial and recreational fisheries, thus in principle, fisheryindependent sampling should not count towards any state's requirements. Additionally, fishery-independent lengths are not technically suitable for describing the lengthfrequency of the fisheries' catch, although fishery-independent otoliths may be obtained that adequately represent the length-frequency distribution of the dependent samples and are useful in age-length keys. The difficulty is in collecting fishery-independent otoliths that are representative of the larger fish harvested in commercial fisheries, particularly in the northern range of weakfish. Therefore, the PRT feels that lengths must be collected from fishery-dependent sources and that every effort should be made to collect otoliths from fishery-dependent sources. However, the PRT could permit fishery-independent otoliths that are representative of the fisheries for the Addendum I sampling requirements during this period of low weakfish abundance. This discussion is in no means meant to diminish the value of survey work, as fishery independent age and length data are extremely valuable in the weakfish stock assessment process.

## Research Recommendations

## Biological

## High Priority

- Collect catch and effort data including size and age composition of the catch, determine stock mortality throughout the range, and define gear characteristics. In particular, increase length-frequency sampling in fisheries from Maryland north.
- Derive estimates of discard mortality rates and the magnitude of discards for all commercial gear types from both directed and non-directed fisheries. In particular, quantify trawl bycatch, refine estimates of mortality for below minimum size fish, and focus on factors such as distance from shore and geographical differences.
- Conduct an age validation study.
- Identify stocks and determine coastal movements and the extent of stock mixing, including characterization of stocks in over-wintering grounds (e.g., tagging).
- Conduct spatial and temporal analysis of the fishery independent survey data. The analysis should assess the impact of the variability of the surveys in regards to gear, time of year, and geographic coverage on their (survey) use as stock indicators.
- Analyze the spawner recruit relationship and examine the relationships between parental stock size and environmental factors on year-class strength.

## Medium Priority

- Biological studies should be conducted to better understand migratory aspects and how this relates to observed trends in weight at age. Test for individual growth difference and he geospatial pattern, as well as the geospatial pattern of the catch rate surveys.
- Define reproductive biology of weakfish, including size at sexual maturity, maturity schedules, fecundity, and spawning periodicity. Continue research on female spawning patterns: what is the seasonal and geographical extent of "batch" spawning; do females exhibit spawning site fidelity?
- Continue studies on mesh-size selectivity, particularly for trawl fisheries.
- Continue studies on recreational hook-and-release mortality rates, including factors such as depth, warmer water temperatures, and fish size in the analysis. Studies are needed in deep and warm water conditions. Further consideration of release mortality in both the recreational and commercial fisheries is needed, and methods investigated to improve survival among released fish.

## Low Priority

- Develop a coastwide tagging database.

## Social

- Assemble socio-demographic-economic data as it becomes available from ACCSP.

## Economic

- Assemble socio-demographic-economic data as it becomes available from ACCSP.
- Detailed information on production activities (e.g., fishing effort and labor used by gear, vessel characteristics, areas fished, etc.) and costs and earnings for the harvesting and processing sectors.
- Information on retail sales and demand for weakfish in order to estimate the demand and economic benefits of at-home and away-from home consumption of weakfish.
- Development of bio-economic models that link the underlying population dynamics to the economic aspects of the commercial and recreational fisheries.
- Distribution of weakfish to the various markets and across states.
- Information on the margins of various stages of processing and marketing also need to be obtained; this information is necessary to construct mathematical models that can be used to estimate the economic impacts of management and regulation.
- A directed data collection program for weakfish including the same variables presently collected by NMFS in support of MRFSS and by the economic add-on. Data collected includes information on travel distance, mode of angling, expenditures, area fished, catch on previous trips, and other information.
- Development of commercial decision-making or behavioral models to explain how fishers might respond to various regulations.
- Estimation and assessment of consumer (net economic benefits to consumers) and producer (net economic benefits or profits to producers) surplus; the sum of consumer and producer surplus is a measure of the net economic value to society of a good or service.
- Development of input/output models for all states having commercial weakfish activity, or alternatively, full-blown economic impact models, which might consist of input/output models or General Equilibrium models.
- Determination of the economic value derived from recreational angling including the economic value of a catch and release fishery

## Habitat

- Conduct hydrophonic studies to delineate weakfish spawning habitat locations and environmental preferences (temperature, depth, substrate, etc.) and enable quantification of spawning habitat.
- Compile existing data on larval and juvenile distribution from existing databases in order to obtain preliminary indications of spawning and nursery habitat location and extent.
- Document the impact of power plants and other water intakes on larval, post larval and juvenile weakfish mortality in spawning and nursery areas, and calculate the resulting impacts on adult stock size.
- Define restrictions necessary for implementation of projects in spawning and overwintering areas and develop policies on limiting development projects seasonally or spatially.

## XI. Tables

Table 1. Summary of state regulations for weakfish in 2007

|  | Commercial | Recreational |
| :---: | :---: | :---: |
| MA | All gears: 16". Open: January 1 - December 31. | 16", 10 fish until October 19, then 6 fish |
| RI | All gears: 16 "; open $6 / 1-6 / 30 \& 8 / 7-11 / 8 ; 150 \mathrm{lb}$ bycatch limit. Directed trawl: codend mesh size $\geq 4.5$ " diamond or 4.0 square. | 16", 10 fish until August 21, then 6 fish |
| CT | All gears: 16"; open January 1 - December 31. | $\begin{aligned} & 16 \text { ", } 10 \text { fish until } \\ & \text { October } 29 \text {, then } 6 \text { fish } \end{aligned}$ |
| NY | Hook \& line: 16 "; open 4/1-6/24 \& 8/28-11/15; 0 lb bycatch limit. All other gears: 10 " filleted \& 12 " dressed; open $4 / 1-6 / 24$ and $8 / 28-11 / 15$; 300 lb bycatch limit. | 16", 6 fish |
| NJ | Gill net: 13"; open 1/1-5/20 \& 9/3-10/19 \& 10/27-12/31; 150 lb bycatch limit; mesh $\geq 3.25$ " stretched except $2.75-3.25$ " stretched allowed within 2 nm for permitted fishermen doing monthly reporting. Otter trawl: open 1/1-7/31 @ 13" \& 10/13-12/31 @ 12"; mesh $\geq 3.75$ " diamond or 3.375 square. Pound net: 13"; open 1/1/-6/6 \& 7/1-12/31. Hook \& line: 13", 8 fish, open 1/1-12/31. | 13", 8 fish until October 1 , then 6 fish |
| DE | Gill net: 12"; open 4/1-9/30 except 34 specified days; mesh $\geq 3.125^{\prime \prime}$. Hook \& line: 13"; unlimited possession 4 days/week, 8 fish creel limit 3 days/week. 0 lb . bycatch limit. | 13", 8 fish until October 1 , then 6 fish |
| MD | All gears: 12"; 150 lb bycatch limit. Gillnet mesh $\geq 3.0$ " stretched. Trawl mesh $\geq 3.375$ " square or 3.75 " diamond. Ocean trawl open: 10/18-12/25. All other gears ocean: open $3 / 26-4 / 26 \& 9 / 3-11 / 14$. All gears Chesapeake Bay: open 8/5-9/30. | 13", 8 fish until October 22, then 6 fish |
| PR | All gears: 12"; open 7/28-12/31; 150 lb bycatch limit for certified pound nets with approved cull panels and 0 lb bycatch for all other gears. | 12", 7 fish until March 18, then 6 fish |
| VA | Gill net: 12 "; open $3 / 16-5 / 13 \& 10 / 21-12 / 30$. Pound net: no minimum size; open 4/1-4/31 \& 5/23-9/12. Haul seine: no minimum size; open 4/16-6/10 \& 8/21-9/24. Out of state trawl: 12" except 300 undersized fish allowed; open 4/1-9/25; codend mesh $\geq 3.0$ ". All gears: 300 lb bycatch limit until October 1, then 150 lb . | 12", 7 fish until October 1 , then 6 fish |
| NC | All gears 12", except long haul seines and pound nets 10". No closed seasons. Gill net: mesh $\geq 2.875^{\prime \prime}$ stretch. Gears not meeting minimum mesh sizes: 300 lb bycatch limit until October 1, then 150 lb . Shrimp and crab trawl: 150 lb bycatch limit, $50 \%$ rule. BRDs in shrimp trawls. | 12", 7 fish until October 1 , then 6 fish |
| SC | None | None until June 15, then 12 "and 10 fish |
| GA | 13", 6 fish | 13", 6 fish |
| FL | All gears: 12". Gill and entangling nets prohibited in state waters. Other nets restricted to $500 \mathrm{ft} \wedge 2$ in state waters and vessels restricted to two nets and people not on vessel to one net. | 12", 4 fish |

Table 2. Comparison of commercial and recreational Atlantic coast weakfish landings (see Tables 3 and 4 for source information and state-specific landings)

Notes: FL: state-reported landings from 1985-present (NMFS-reported estimates adjusted for weakfish, sand seatrout, and hybrids). NC: state-reported landings from 1994-present. VA: landings from 1982-1992 are NMFS-reported minus the PRFC-reported harvest landed in VA; state reported landings from 1993-present (exclude Potomac River harvest). PRFC: agency-reported landings from 1982-present (fish caught in Potomac River and landed in MD and VA). MD: statereported landings from 1982-present (exclude Potomac River harvest). DE: state-reported landings from 1985-present. NJ: state-reported landings for 2005present. CT: state-reported landings from 1995-present. RI: SAFIS landings from 2005-present.
