## I. Status of the Fishery Management Plan

Date of FMP Approval:
Amendments:
Management Unit:

States With Declared Interest:
Additional Jurisdictions:

Active Boards/Committees:

Original FMP: October 1981
Amendment 6: February 2003 (active January 2004)
Migratory stocks of Atlantic striped bass from Maine through North Carolina

Maine - North Carolina, including Pennsylvania
District of Columbia, Potomac River Fisheries Commission, National Marine Fisheries Service, United States Fish and Wildlife Service

Atlantic Striped Bass Management Board, Advisory Panel, Technical Committee, Stock Assessment Subcommittee, Tagging Subcommittee, Plan Review Team, and Plan Development Team

Jurisdictions with a declared interest in striped bass are Maine through North Carolina, including Pennsylvania, the Potomac River Fisheries Commission, the District of Columbia, the National Marine Fisheries Service, and the United States Fish and Wildlife Service. Under the Atlantic Striped Bass Conservation Act (P.L. 98-613), implementation of the Fishery Management Plan (FMP) is mandatory. Compliance with the FMP is monitored by the Commission's Striped Bass Management Board (Board) and Striped Bass Plan Review Team (PRT). Amendment 6 to the FMP was approved in February 2003, fully implemented by January 1, 2004, and completely replaces all previous Commission plans for Atlantic striped bass.

Amendment 6 was developed to address five limitations within the previous management program: potential inability to prevent the Amendment 5 exploitation target from being exceeded; perceived decrease in availability or abundance of large striped bass in the coastal migratory population; a lack of management direction with respect to target and threshold biomass levels; inequitable effects of regulations on the recreational and commercial fisheries, and coastal and producer area sectors; and excessively frequent changes to the management program.

Amendment 6 established biological reference points (BRPs) to define overfished stock status and overfishing. Overfished status is defined by a threshold female spawning stock biomass (SSB) of 30.9 million pounds, with a target SSB of 38.6 million pounds. Overfishing is defined by a threshold fishing mortality rate ( F ) of 0.41 , with a target F of 0.30 . (The Chesapeake Bay and Albemarle-Roanoke stocks operate under a separate target F; see next paragraph.) The BRPs form the basis of a list of triggers, which if any were reached would require the Board to alter the management program to ensure that the Amendment 6 objectives are met. (The list includes a trigger using juvenile abundance indices; see Section VI.)

Recreational striped bass fisheries are managed with size and creel limits meant to achieve the target fishing mortality rate. Most recreational fisheries are constrained by a two fish creel limit,

28 inch minimum size limit, and 365-day fishing season except in spawning areas. Through Management Program Equivalency, Amendment 6 granted the responsible jurisdictions the ability to employ a smaller minimum size limit ( 18 inches) in the Chesapeake Bay and Albemarle Sound/Roanoke River with the penalty of a target F of 0.27 .

Commercial striped bass fisheries are constrained by minimum size limits and state-by-state quotas. The same minimum size standards regulate the commercial fisheries as the recreational fisheries, except for a 20 inch size limit in the Delaware Bay spring gillnet fishery. Amendment 6 restored the coastal commercial quotas to the average reported landings from 1972-1979, except for Delaware's coastal commercial quota, which remains at the level allocated in 2002. The responsible jurisdictions set quotas for the Chesapeake Bay and Albemarle Sound/Roanoke River commercial fisheries based on the $0.27 \operatorname{target} \mathrm{~F}$.

States are permitted the flexibility to deviate from these standards by submitting proposals for review by the Striped Bass Technical Committee and Advisory Panel and contingent upon the approval of the Management Board. Alternative proposals must be "conservationally equivalent" to the management standards. This practice has resulted in a wide variety of regulations among states (see Tables 1 and 2).

The Exclusive Economic Zone (EEZ) has been closed to the harvest and possession of striped bass since 1990. A recommendation was made in Amendment 6, and submitted to the Secretary of Commerce, to re-open federal waters to commercial and recreational fisheries. Starting in July 2003 and continuing for several years, NOAA Fisheries took steps in the rulemaking process to consider the proposal, including publishing an Advance Notice of Proposed Action, a Notice of Intent to Prepare an Environmental Impact Statement, and an options paper for management strategies in the EEZ, and initiating several public comment periods. In September 2006, NOAA Fisheries concluded that it would be imprudent to open the EEZ to striped bass fishing and chose not to proceed further in its rulemaking.

## II. Status of the Stocks

In February 2006, the Striped Bass Technical Committee submitted a request to the Board to defer the 2006 annual update stock assessment in favor of having more time to prepare new methods and better data for the 2007 benchmark stock assessment. The Board approved this request such that the most recent estimates on stock status are for 2004 (from the 2005 stock assessment report). The 2005 assessment determined that striped bass were not overfished and overfishing did not occur in 2004. The following paragraphs provide the basis for this determination.

Spawning stock biomass (SSB) and recruitment estimates were derived from catch-at-age based virtual population analyses (VPA). Female SSB for 2004 was estimated at 55 million pounds, well above the Amendment 6 threshold SSB ( 30.9 million pounds), as well as the target SSB ( 38.6 million pounds; Figure 1). Although above the target and threshold levels since 1996, SSB has declined by $9 \%$ since 2002 when it peaked at 60.6 million pounds. Recruitment of the 2004 cohort for all stocks was estimated as 12.7 million age- 1 fish, which is close to the average age- 1 recruitment observed since the stocks were declared recovered in 1995.

Fishing mortality rate (F) estimates are available from VPA (Figure 1) as well as tagging data analyses. Both methods show a general trend upwards since the fishing moratoria of the mid-

1980s, although they differ in their estimates. Based on VPA results, the average F for age 8-11 fish has increased annually since 2000, equaling 0.40 in 2004, which is above the Amendment 6 F target of 0.30 , but below the overfishing threshold of 0.41 . It was the consensus of the Technical Committee, however, that this was likely an overestimate due to a pattern of overestimating F in the last year of the model. The 2003 value of F from the 2005 VPA is 0.29 , which is substantially lower than the terminal year F from the 2004 VPA run of 0.62 . This is due not only to the addition of another year's worth of data, but to the modified suite of tuning indices used in the 2005 VPA and the inclusion of wave 1 (Jan./Feb.) estimates of recreational harvest mortality from North Carolina and Virginia for 1996-2004.

Two methods of using the tagging data, the constant-M approach and the catch-equation, provide stock-specific F estimates and coastwide average F estimates. The 2004 tag-based estimates of F using a constant M of 0.15 were as follows: for fish greater than 28 inches, the coast-wide average F equaled 0.29 , and specific tagging program values ranged from 0.02 in the New York ocean haul survey to 0.31 in the Maryland tagging program; for fish greater than 18 inches, the coast-wide average $F$ equaled 0.29 , and specific tagging program values ranging from 0.06 in the Virginia spawning stock program to 0.68 in the New Jersey Delaware Bay program. The 2004 catchequation based estimates of F are as follows: for fish greater than 28 inches, the coast-wide average F equaled 0.14 , and specific tagging program values ranged from 0.09 in the Virginia spawning stock program to 0.26 in the Delaware and Pennsylvania tagging program; for fish greater than 18 inches, the coast-wide average $F$ equaled 0.11 , and specific tagging program values ranged from 0.05 in three different programs to 0.17 in the Maryland program.

Chesapeake Bay fishing mortality in 2004 was estimated as $\mathrm{F}=0.16$ by the direct enumeration study. This F represents mortality during the June 2003 - June 2004 period, so it is not directly comparable to the average, weighted (by N) VPA calendar-year F on age 3-8 striped bass that is equal to 0.12 .

Population estimates were calculated from both VPA and tag-based F estimates using the catch equation. The estimate of total abundance for January 1, 2005 from the VPA was 65.3 million age1 and older fish. This estimate is about 1.2 million fish lower than for 2004, but $10 \%$ higher than the average stock size for the previous five years. From the tag-based F estimates using the catch equation, the 2004 population estimate for age $3+$ fish was 48.5 million fish, which is roughly 8 million fish higher than the 2003 estimate. This tag-based estimate is higher than the VPA estimate of 39.2 million age $3+$ fish at the beginning of 2004. This discrepancy in population estimates between the two approaches increased with older age classes. The VPA estimated the age $7+$ population to number 9.4 million fish, whereas the tag-based approach estimated 17.1 million fish. The VPA-estimated abundance of older fish (age 13+) in the stock increased from 382,000 fish at the beginning of 2003 to 547,000 fish on January 1, 2005.

## III. Status of the Fishery

Total striped bass harvest in 2006 is estimated at 3.81 million fish ( 36.47 million pounds; Tables 3,4 and 6 ). The commercial fishery harvested $28.4 \%$ of the total by number of fish, or $19.0 \%$ by weight of fish, whereas the recreational fishery harvested $71.6 \%$ of the total by number of fish, or $81.0 \%$ by weight of fish. The total number of fish harvested increased by $14.8 \%$ from 2005 ( 3.32 million fish). This increase is largely attributable to growth in the recreational harvest, which increased from 2.34 million fish in 2005 to 2.71 million fish in 2006 (Table 5), rather than
the commercial fishery, which increased from 1.01 million fish in 2005 to 1.08 million fish in 2006 (Table 3). By weight, the commercial fishery decreased from 2005 to 2006 by nearly 1 million pounds (Table 4). Additionally, recreational dead discards ( 2.1 million fish; Table 3) increased by $36.8 \%$ by number of fish from 2005. The total number of recreational removals in 2006 increased by about $24 \%$ from 2005.

In 2006, the recreational fishery harvested an estimated 2.71 million fish (approximately 29.5 million pounds; Tables 5 and 6). Recreational releases totaled nearly 26.0 million fish (Table 7), for an estimated 2.1 million dead discarded fish (Table 3). Recreationally harvested fish and dead discards account for $56.6 \%$ and $43.4 \%$, respectively, of the total 2006 recreational removals. The Maryland recreational fishery harvested $24.4 \%$ of the recreational landings in number of fish, followed by Virginia (19.5\%), New Jersey (18.1\%), Massachusetts (12.8\%), and New York ( $11.5 \%$ ). The remaining states each landed less than $4.0 \%$ of the 2006 recreational harvest by number of fish.

The commercial fishery landed an estimated 1.1 million fish in 2006 ( 6.9 million pounds; Tables 3 and 4). An estimate for 2006 commercial dead discards is not available to provide the percent contribution of commercial harvest and dead discards to total commercial mortality; however, in 2004, commercial harvest contributed $63.6 \%$ to the total commercial removals ( 0.91 million fish) and dead discards contributed $36.4 \%$ ( 0.52 million fish). The Chesapeake Bay jurisdictions dominated the 2006 commercial harvest; by pounds, Virginia landed 27.9\%, Maryland landed $26.6 \%$, and PRFC landed $6.8 \%$. Elsewhere along the coast, Massachusetts landed $14.0 \%$ of the commercial harvest by pounds, North Carolina $10.8 \%$, and New York $9.0 \%$. Delaware and Rhode Island each landed less than $3.0 \%$ of the total commercial landings by pounds.

An estimate for commercial discards in 2006 is unavailable at the writing of this report. (An estimate will be available in 2008 as a product of this year's stock assessment.) Thus, the 2004 data are used to portray the proportion of the total catch attributable to recreational harvest, recreational dead discards, commercial harvest, and commercial dead discards (Figure 2).

## IV. Status of Assessment Advice

The Atlantic striped bass coastwide stock assessment was peer reviewed by the $36^{\text {th }}$ Stock Assessment Workshop/Stock Assessment Review Committee (SAW/SARC) in 2002 (NEFSC 2003). In addition to reviewing the results of the stock assessment, the SARC was asked to comment specifically on the model configuration of the VPA and provide advice on the plus grouping, oldest true age for fishing mortality, and the use of all striped bass fishery independent surveys. As a result of the advice, the fully recruited F calculated in each assessment since 2002 is based on ages $8-11$ to conform to the biological reference points in Amendment 6, and consequently, is not directly comparable with age 5-11 Fs used in previous assessments.

The Striped Bass Stock Assessment and Tagging subcommittees have completed annual updates to the assessment since the $36^{\text {th }}$ SAW/SARC, except in 2006, when the Board permitted the subcommittees to skip an update to explore new approaches and improve available data for the next benchmark assessment in 2007. The $46^{\text {th }}$ SAW/SARC will peer review this striped bass stock assessment in late November.

## V. Status of Research and Monitoring

The management plan requires certain jurisdictions to implement fishery-dependent monitoring programs for striped bass. All jurisdictions with commercial fisheries (Massachusetts, Rhode Island, New York, Delaware, Maryland, Virginia, PRFC, and North Carolina) or significant recreational fisheries (Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Maryland, Virginia, and PRFC) are required to define the catch composition of these fisheries. Jurisdictions with significant commercial fisheries (Massachusetts, New York, Maryland, Virginia, and PRFC) and those agencies monitoring recreational fisheries (NOAA Fisheries, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Maryland, Virginia, and PRFC) are required to gather representative catch and effort data for these fisheries.

In addition to fishery dependent monitoring programs, the management plan requires certain states to monitor the striped bass population independent of the fishery. Juvenile abundance indices are required from Maine (Kennebec River), New York (Hudson River), New Jersey (Delaware River), Maryland (Chesapeake Bay tributaries), Virginia (Chesapeake Bay tributaries), and North Carolina (Albemarle Sound). Spawning stock sampling is mandatory for New York (Hudson River), Pennsylvania (Delaware River), Delaware (Delaware River), Maryland (Upper Chesapeake Bay and Potomac River), Virginia (Rappahannock River and James River), and North Carolina (Roanoke River and Albemarle Sound). Amendment 6 requires NOAA Fisheries, USFWS, Massachusetts, New York, New Jersey, Maryland, Virginia, and North Carolina to continue their tagging programs, which provide data used to determine survivorship and migration patterns.

## VI. Status of Management Measures and Issues

## Status of Amendment 6

Amendment 6 was fully implemented by January 1, 2004, and provided the regulatory measures for the 2006 fishing year. At present, Addendum I to Amendment 6 is under development. During the development of Amendment 6, the Management Board raised concerns over the effects of discard mortality on the overall population and agreed to develop a data collection program to collect the information necessary to evaluate the accuracy of the current discard and discard mortality estimates. Based on the guidance in Amendment 6, the Board is developing Addendum I to establish the data collection program. The draft addendum went to public comment in late summer to early fall of 2006. In October 2006, the Board postponed further consideration of the addendum until October 2007 to allow staff to further develop the addendum.

Presently, NOAA Fisheries maintains a ban on all striped bass fishing activity and possession of striped bass in the EEZ with the exception of a defined route to and from Block Island in Rhode Island.

## Coastal Commercial Quota

Table 8 shows a history of coastal commercial quotas and harvests since the implementation of Amendment 6. In 2006, four states had coastal commercial quotas lower than their Amendment 6 allocation: Massachusetts and Rhode Island due to quota overages in 2005, and New York and Maryland due to conservation equivalencies related to their minimum size limits.

In 2006, two states exceeded their coastal commercial quotas and should have their 2007 quotas lowered accordingly (Table 8). Massachusetts exceeded its coastal commercial quota by 171,687 pounds, resulting in an adjusted 2007 quota of 988,063 pounds. Virginia exceeded its coastal commercial quota by 10,081 pounds, for an adjusted 2007 quota of 174,772 pounds.

## Chesapeake Bay Quota

Amendment 6 implements a separate management program for the Chesapeake Bay due to the size availability of striped bass in this area. Based on a target fishing mortality rate of $\mathrm{F}=0.27$, a bay-wide quota for resident fish is established for the Chesapeake Bay and shares are allocated to Maryland, Virginia, and the Potomac River Fisheries Commission (PRFC). In 2006, the baywide quota of $9,476,867$ pounds was allocated among the three jurisdictions. (Based on historical harvest, Maryland is allocated $\sim 52 \%$, PRFC $\sim 15 \%$, and Virginia $\sim 33 \%$ ). Each jurisdiction then allocates portions of the quota to its recreational and commercial fisheries (Table 9). In 2006, the bay-wide harvest was approximately 600,000 pounds less than the baywide quota.

## Chesapeake Bay Spring Trophy Fishery

Recreational fishermen in the Chesapeake Bay are permitted to take adult migrant fish during a limited seasonal fishery, commonly referred to as the Spring Trophy Fishery. Staring in 1993, the fishery has been controlled by a Board-approved harvest cap, which started at 3,000 fish, and increased to 5,000 fish in 1994, 25,000 fish in 1995, and 30,000 fish in 1996. In December 2003, the Board approved a new methodology to establish the annual quota for the fishery. Each year, the Chesapeake Bay states would be required to submit a harvest report for the spring trophy fishery and propose a new quota for the subsequent year. This quota was to be a set proportion of the number of age $8+$ striped bass in the population, as determined annually by the VPA output, minus any overage from the previous year's fishery.

In each of the last several years, the spring trophy fishery has taken more fish than the quota, which has resulted in an overage-adjusted quota for each subsequent year. Table 10 summarizes the quotas, harvests, overages, and adjusted quotas for 2003-2006. The 2006 spring trophy fishery exceeded its adjusted quota by 26,283 fish. In January 2007, Maryland proposed to eliminate the quota system for the spring trophy fishery. Instead, the Board approved a target harvest for 2007 of the VPA calculated quota minus the 2006 overage, to be no less than 30,000 fish. This method resulted in a 30,000 fish target for 2007.

## Law Enforcement

The 2006 Law Enforcement Committee reports that the FMP for striped bass is enforceable as written. Striped bass enforcement is a high priority with all Atlantic states and a significant amount of effort has been expended to obtain overall compliance. Joint Enforcement Agreements (JEAs) between the NMFS/OLE, USCG, and the individual state exist in all states of the management unit, except North Carolina. The JEAs expanded enforcement efforts in the EEZ for the second year in a row in 2006, leading to several large confiscations of illegally harvested striped bass. In Virginia, over 60 arrests were made for striped bass fishing in the EEZ during winter 2006 and early 2007. New Hampshire has also seen an increase in apprehensions. Of note is that NMFS increased the fine structure for the illegal harvest and possession of recreationallycaught striped bass in the EEZ. Fines increased from $\$ 50$ per fish to $\$ 100$ per fish (up to 10 fish) for first time offenders. For second time offenders, agents and officers may place a $\$ 250$ per fish fine (up to 10 fish) on the fishermen or refer the case for prosecution in the federal court system.

If more than 10 fish are found in any case, the matter should be forwarded to NOAA's General Counsel for Enforcement and Litigation for prosecution and stiffer penalties. Enforcement efforts, coupled with the higher fines, appear to be having a positive effect on compliance. Preliminary reports indicate increasing compliance in the EEZ by recreational anglers from the mid-Atlantic states.

## Juvenile Abundance Indices

In response to the suite of management triggers introduced in Amendment 6, the Technical Committee annually examines the trends in all required Juvenile Abundance Index (JAI) surveys. The Technical Committee is to recommend appropriate action to the Management Board if any JAI shows recruitment failure for three consecutive years. Recruitment failure is defined as a JAI lower than $75 \%$ of all other values in the dataset. The geometric mean is the preferred index of YOY striped bass abundance to model stock status.

The Technical Committee has yet to examine the trends in the JAIs for 2006; however, the Plan Review Team provides the following preliminary summary of the indices. The JAIs in Maine and Virginia indicate that the 2006 year class is above the time-series average, while the New York, New Jersey, Maryland, and North Carolina indices were below their time-series averages.

## Albemarle/Roanoke Striped Bass FMP

The Interstate FMP for Atlantic Striped Bass requires North Carolina to inform the Commission of changes to striped bass management in the Albemarle Sound/Roanoke River (A/R) System. North Carolina must adhere to the compliance criteria in Amendment 6. After a Technical Committee review, the PRT previously determined that North Carolina's FMP complies with the mandatory components of Amendment 6.

The A/R System is managed jointly for striped bass by the North Carolina Department of Environment and Natural Resources, Division of Marine Fisheries, which manages the Albemarle Sound Management Area (ASMA), and the North Carolina Wildlife Resources Commission, Division of Inland Fisheries, which manages the Roanoke River Management Area (RRMA). The 2003 FMP, which updated the 1994 FMP, explores harvest options and identifies management measures and research needs to promote recovery of striped bass stock in the central and southern areas of North Carolina (Tar-Pamlico, Neuse, and Cape Fear rivers). The FMP contains a target fishing mortality rate ( $\mathrm{F}_{\text {target }}=0.22$ ) and threshold spawning stock biomass ( 400,000 pounds) for the $\mathrm{A} / \mathrm{R}$ System. The annual total allowable catch ( 550,000 pounds in 2006) is allocated evenly between the recreational and commercial fisheries, with $25 \%$ for the RRMA recreational fishery, $25 \%$ for the ASMA recreational fishery, and $50 \%$ for the ASMA commercial fishery. The FMP implements overage penalties for future overages, addresses habitat and environmental issues, catch and release mortality in hook and release fisheries, discards in the multispecies gillnet fishery, enforcement of creel limits, and maintains the Albemarle Sound Management Area boundary line.
Total 2006 harvest in the A/R System is estimated as 276,822 pounds and total losses as 346,602 pounds. During the 2006 fishing year, one regulatory change occurred. In the fall ASMA recreational fishery, the creel limit was increased from two fish per day to three fish per day, due to low harvest in the spring fishery. This change is expected to continue in 2007. Additionally in 2007, the RRMA recreational fishery operated under one open season for the whole river from March 1 to April 30 (rather than two zones with individual open seasons).

## VII. Annual State Compliance

Based on the annual state compliance reports, the Plan Review Team determined that each state/jurisdiction implemented a management program that was approved by the Striped Bass Management Board for the 2006 fishing year and was consistent with the requirements of Amendment 6. (See Tables 1 and 2 for state-by-state regulations.)

Several states indicated planned regulatory change(s) for the 2007 fishery. These include:

- Rhode Island: the 2007 possession limit during both sub-periods of the general category commercial fishery will increase from present limits to five fish per vessel per day. Rhode island has also submitted a proposal to lower the trap fishery's minimum size limit to 26 inches while decreasing its quota to 93,788 pounds. Board approval is required for the state to implement this proposed regulation.
- New York: indicated its intent to submit a proposal to increase the Hudson River recreational fishery minimum size limit to 28 inches. When submitted, the proposal will require Technical Committee review and Management Board approval.
- Chesapeake Bay Spring Trophy Fishery: the Board approved a 30,000 fish target for 2007. Maryland altered its regulations to comply: with a season of April 21-May 15, anglers were permitted to harvest one fish per day, measuring 28-35 inches or greater than 41 inches.
- North Carolina: implemented a mandatory Coastal Recreational Fishing License in 2007; continued a recreational angler requirement to report harvest from May through August from NC/VA line above Corolla, south to Oregon inlet; holding public hearings for a proposal to require coastal commercial fishermen to declare which one of the three gear types they will use for the next three years (to limit entry into the fisheries and reduce competition and conflict between user groups).

Amendment 6 has several compliance requirements as part of the interstate striped bass management program, including both monitoring and regulatory requirements, which are enforceable through the Atlantic Striped Bass Conservation Act. The monitoring requirements for each jurisdiction are summarized in Section $V$ of this report. Compliance with these requirements is summarized in Table 11. The PRT found all states carried out the required monitoring programs and implemented the mandatory regulatory requirements in the 2006 fishing year.

Amendment 6 also requires states to submit annual law enforcement activity reports. These reports, in a standardized format, detail the effort and success involved in enforcing striped bass regulations in each jurisdiction. For the 2006 fishing year, the states submitted their law enforcement reports to the Commission's Law Enforcement Coordinator and one Law Enforcement Report was submitted on behalf of all the states in the striped bass management unit. The striped bass law enforcement report is summarized in Section VI of this report.

## VIII. Recommendations

## Regulatory Recommendations

- The 2007 coastal commercial quotas for Massachusetts and Virginia should be lowered by the amounts the states harvested in excess of their 2006 allocations (Table 8).

## Management Recommendations

- Some disagreement has been voiced as to the meaning of Section 4.1 of Amendment 6. This section describes a new planning horizon for striped bass management, stating: "beginning in the third year after the implementation of Amendment 6 , any management measures established by the Management Board will be maintained by the states for three years, unless a target or threshold is violated." This section can be taken to mean that from 2006 to 2008, no new state proposals to alter regulations should be submitted, or it could be taken to mean that no new amendments or addenda should be implemented by the Board (other than Addendum I which Amendment 6 requires). The PRT recommends that the Board discuss and clarify the intent of Section 4.1 to Amendment 6.

## Research Recommendations

## STOCK ASSESSMENT AND POPULATION DYNAMICS

## High Priority

- Develop method to integrate VPA and tagging models to produce a single estimate of F and stock status (ongoing, G. Nelson)
- Evaluate alternative catch at age models for striped bass (ongoing, G. Nelson, L. Lee).
- Examine reporting rates by commercial and recreational fishermen using high reward tags (ongoing, J. Hoenig)
- Develop studies to provide information on gear-specific discard morality rates and to determine the magnitude of bycatch mortality, including factors that influence their magnitude and means of reducing or eliminating this source of mortality. Additionally, increase sea sampling of commercial fisheries to better estimate levels of discards (ongoing, G. Nelson).
- Review relationship between tag-based survival estimates and VPA estimate of mortality in a management framework.
- Develop maturity ogive applicable to coastal migratory stock.
- Develop methods for combining tag results from programs releasing fish from different areas on different dates.
- Examine potential biases associated with the number of tagged individuals, such as gearspecific mortality (associated with trawls, pound nets, gill nets, and electrofishing), taginduced mortality, and tag loss.
- Estimate striped bass harvest removals in coastal areas during wave 1 and in inland waters of all jurisdictions year-round.

## Medium Priority

- Improve methods for determining population sex ratio for use in estimates of spawning stock biomass and biological reference points.
- Develop refined and cost-efficient fisheries-independent coastal population index for striped bass stocks.
- Quota calculation methods should be refined which allow better estimates among various components of the fishery.
- Examine methods to estimate annual variation in natural mortality (ongoing, Striped Bass Tagging Subcommittee).
- Examine causes of different tag-based survival estimates among programs estimating similar segments of the population.
- Evaluate truncated matrices and covariate-based tagging models.
- Develop reliable estimates of poaching loss from striped bass fisheries.

## Low Priority

- Evaluate the overfishing definition relative to uncertainty in biological parameters.
- Develop simulation models to look at the implications of overfishing definitions relative to development of a striped bass population that will provide "quality" fishing. Quality fishing must first be defined.
- Examine issues with time saturated tagging models for the $\geq 18$ inch length group.

## RESEARCH AND DATA NEEDS

## High Priority

- Continue in-depth analysis of migrations, stock compositions, etc. using mark-recapture data (ongoing, e.g., Cooperative Winter Tagging Cruise 20 Year Report, W. Laney)
- Continue evaluation of striped bass dietary needs and relation to health condition (ongoing, R. Latour, A. Overton).

## Medium Priority

- Continue to conduct research to determine limiting factors affecting recruitment and possible density implications.
- Evaluate the percentage of fishermen using circle hooks.
- Conduct study to calculate the emigration rates from producer areas now that population levels are high and conduct multi-year study to determine inter-annual variation in emigration rates.

## Low Priority

- Determine inherent viability of eggs and larvae.
- Conduct additional research to determine the pathogenicity of the IPN virus isolated from striped bass to other warm water marine species, such as flounder, menhaden, shad, largemouth bass, and catfish.

## IX. Figures

Figure 1. VPA-based average fishing mortality ( F ) for age 8-11 fish and spawning stock biomass (SSB), 1982-2004. The VPA-based F for 2004 (0.40) is not shown because the Technical Committee concluded that it was not reliable due to the observed restrospective pattern. Target and threshold levels for F (plain lines) and SSB (dotted lines) are also shown (Source: ASMFC 2005)

Figure 2. 2004 Striped Bass Total Catch ( 5.2 million fish)
(Source: ASMFC 2005)

## X. Tables

Table 1. Atlantic Striped Bass Commercial Fishery Regulations for 2006

| STATE | SIZE LIMITS | QUOTA | OPEN SEASON |
| :---: | :---: | :---: | :---: |
| Maine | No Fishery |  |  |
| New Hampshire | No Fishery |  |  |
| Massachusetts | 34 " min. | Hook \& line: $1,149,975 \mathrm{lb} .$ | $7.12-8.24$ 5 fish on Sun, 30 fish/day Tues-Thurs |

## Notes

* Total Removals are incomplete without commercial dead discards. An estimate of commercial dead discards will not be available until the 2007 Striped Bass Stock Assessment is complete.
New York recreational discards include recreational discards in Hudson River.
New Jersey commercial harvest is that taken through the striped bass bonus program.
Pennsylvania reported that no work was done in 2006 to characterize recreational harvest.
Maryland estimates are coastal and bay combined estimates.
Recreational harvest in the Potomac River is included in Maryland and Virginia recreational harvest estimates.
Virginia estimates are coastal and bay combined estimates.
North Carolina estimates include inland harvest.

* Preliminary data from state reports

Maryland and Virginia harvests include Chesapeake Bay harvest; North Carolina harvest includes Albemarle Sound harvest. Virginia and Maryland harvest (except 2006) are NMFS reported minus the PRFC estimate of fish caught in the Potomac River and landed in Maryland or Virginia.
All harvests are based on the calendar year.

${ }^{\wedge}$ Quota reduced due to conservation equivalency

* Quota reduced due to overage in the previous year
+NJ quota applied to recreational bonus fish program
$\sim$ NC harvest year is December 1 to November 30

Table 9. Chesapeake Bay Quotas and Harvests (pounds), 2006

| Year: 2006 | Jurisdiction | Quota | Harvest |
| :---: | :---: | :---: | :---: |
| Commercial <br> Fisheries | Maryland | $2,134,116$ | $2,116,257$ |
|  | PRFC | 791,195 | 673,508 |
|  | Virginia | $1,554,302$ | $1,218,584$ |
| Recreational <br> Fisheries | Maryland | $2,795,611$ | $2,350,192$ |
|  | PRFC | 647,341 | $*$ |
|  | Vecreational Subtotal | $\mathbf{4 , 9 9 7 , 2 5 4}$ | $\mathbf{4 , 8 5 9 , 5 9 3}$ |
| Chesapal Subtotal |  | $\mathbf{4 , 4 7 9 , 6 1 3}$ | $\mathbf{4 , 0 0 8 , 3 4 9}$ |
| Cheake Bay Total |  | $\mathbf{9 , 4 7 6 , 8 6 7}$ | $\mathbf{8 , 8 6 7 , 9 4 2}$ |

|  | $\mathbf{2 0 0 3}$ | $\mathbf{2 0 0 4}$ | $\mathbf{2 0 0 5}$ | $\mathbf{2 0 0 6}$ | $\mathbf{2 0 0 7}$ |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Baseline quota | 30,000 | 40,624 | $40,624^{\wedge}$ | 55,208 | 50,030 |
| Previous year overage | 0 | 13,900 | 4,680 | $13,720^{*}$ | 26,283 |
| Adjusted quota | 30,000 | 26,724 | 35,944 | 41,488 | $30,000^{\nabla}$ |
| Harvest | 43,900 | 31,404 | 65,664 | 67,771 |  |
| Overage | 13,900 | 4,680 | 29,720 | 26,283 |  |

${ }^{\wedge}$ The Board approved the same baseline quota for 2005 as used in 2004.

* The 2005 overage of 29,720 fish was adjusted to a direct payback of 13,720 fish under an increased minimum size limit and future additional Maryland effort controls.
$\nabla$ The Board approved a target for the 2007 season of the VPA calculated quota minus the 2006 overage, to be no less than 30,000 fish.

Table 11. Status of compliance with monitoring and reporting requirements ( $\mathrm{Y}=$ compliance standards met, $\mathrm{N}=$ compliance standards not met, $\mathrm{N} / \mathrm{A}=$ not applicable)
